## Introduction

Operations for MIDAS have been more akin to a rover than an orbiter at times - it is very much a "look, see, respond" instrument with several weeks in-between commands being sent to the instrument and the returned outcome. As such, a brief description of the rationale behind images and operations throughout the mission would be a useful addition to allow future investigators to better understand the data and operation of an Atomic Force Microscope (AFM) in space. The following document has been compiled from notes and reports written during and after the operational phase of the mission. While the scientists involved in operations left the project prior to the compilation of this document such that interpretations or additional insight may be missing or limited, it is hoped that the information herein proves some useful information and insights into the difficulties and solutions in operating the first AFM in space, as well as additional information on MIDAS operations and images.

## Typical MIDAS Scan Sequence

## Scan Sequence:

The following describes the steps taken in a typical MIDAS dynamic mode scan.

MIDAS approach to ABS

- Move the coarse approach to a fixed position - executed before an approach to minimum to avoid some motor sticking problems and issues.
MIDAS approach to minimum
- Move the coarse approach to the minimum value (farthest from the sample wheel) - detected by a limit switch
MIDAS linear stage pre-move
- The linear stage moves the wheel (laterally) to position it in front of a cantilever, plus provide coarse X positioning
- This "pre-move" moves the stage to a value always less than the final position so that we always approach the final position from the same side (to avoid any issues of backlash etc.)
MIDAS linear stage move
- The final move, as above.

Move wheel to segment

- Rotate the wheel so that the appropriate target is in front of the XYZ stage - selection of the exact segment provides coarse $Y$ positioning
MIDAS frequency scan
- Select the cantilever and perform a resonance sweep over the (approximately known) resonance peak. This is also where the necessary operating parameters are specified. The resonance sweep starts from a defined frequency and increments this over up to 8 "cycles" of 256 points at the specified frequency step. If a resonance peak, above a given threshold, is found then MIDAS uses the fine step size to increment (positive working point) or decrement (negative working point) the frequency until the working point amplitude has been found. The working point and set points are specified as \% of the peak amplitude.
MIDAS approach to ABS
- Actuate the coarse stage to move the XYZ stage closer to the sample prior to an "approach" (where we look for the surface).
MIDAS scan setup
- Specify the scan parameters - number of steps, step size etc.

## MIDAS scan retract

- Used to ensure certain parameters are set correctly when switching between dynamic and static mode
Approach the surface
- Look for the sample surface - this is done by retracting the $Z$ piezo, moving the linear stage forward slightly, and extending the $Z$ piezo whilst monitoring the cantilever amplitude. If the surface is not found (i.e. the amplitude is NOT reduced to the set point) during this, the piezo is retracted and the linear stage moved forward a small step. This continues until the set point is triggered. This will happen at an unknown piezo extension. To ensure that we have enough dynamic range to image the sample, the piezo should start close to the centre of its range. Thus a piezo centring takes place here in which the $Z$ piezo and approach stage are moved in small increments (and in opposite directions) until the desired piezo extension is recorded, as measured by the strain gauge.
MIDAS scan retract
- Same as last time

MIDAS frequency scan

- Repeat of the frequency scan after the approach, in case time or temperature have changed things during the approach.
MIDAS full scan
- Starts the full scan
- The sequence is similar to dynamic line scans - except that the full scan command is replaced with a line scan. For contact mode scans different parameters are required - and of course no frequency sweeps, since the cantilever is not oscillating - but the overall flow is similar.

## An example scan:

Scan chosen as an example:
RO-C-MIDAS-3-EXT3-SAMPLES-V1.0 IMG_1624607_1627007_157_ZS

Following the above scan sequence we can look at the event history (found in directory EVN of the DATA directory for each dataset in the archive).

| VMDD30E2 $=$ ON* [ENG] \} | \ ThresDetectOnOff |
| VMDDE242 = 1.0 [V] \} | \# SetFSuccessAmplPar) |

which means - use tip number 5, with AC gain 4, excitation level 3. Make a frequency sweep from $81150.8+22.282 \mathrm{~Hz} \sim 81173 \mathrm{~Hz}$ for 8 "cycles" of $256 \times 0.5 \mathrm{~Hz}$ (i.e. sweep a range of 1024 Hz ). Threshold detection is ON , with a value of 1.0 V - so the peak amplitude must be above this. If so, set the frequency to the peak and decrement in steps of 0.05 Hz until the working point of $90 \%$ of the peak amplitude is found.

The set point is $50 \%$ (of the peak), the frequency adjust threshold is $85 \%$ of the peak - if the free amplitude drops below this, an automatic "re-tune" will be triggered. The "DeltaOpPerc" parameter sets a window around the set point into which the sampled amplitude has to fall to trigger the setpoint if in WINDOW mode (ignored if in THRESHOLD).

Check the science data packets:

To show what this actually means, consider a set of so-called "control data" (actually approach curves), these were not taken during this scan but are representative:

Both cases above show the RMS amplitude of the oscillating cantilever decreasing after the tip starts to "tap" the sample. In the first case the amplitude actually rises first, as the van der Waals forces start to act as the tip gets close to the sample and the effective spring constant of the system changes, reducing the resonance frequency and - since we're driving below resonance - increasing the amplitude. Then the tip starts to physical "touch" the sample at the farthest extent of its oscillation. As the tip is moved closer, the amplitude reduces linearly. The second case shows a case where the effect of the setpoint and window can more clearly be seen. The green line represents the setpoint, whilst the red dashed lines reflect the setpoint window; the first point to fall between these points will cause MIDAS to record this point as the surface, retract and move to the next pixel position.

AMDF023A \# MIDAS approach to ABS

AMDF035C \# MIDAS scan setup

Parameters from the command (line 5124 in the ITL):

```

A final note - this is not the full story, since there are also parameters set outside of this "typical" sequence which also affect instrument behaviour. In particular sequence AMDF034B (MD instrument setup) was expanded during the mission to set additional parameters, the most important of which are:

```
VMDDE212 = <sw_flags> \ # SetSwFlagsPar
VMDD5082 = <acreep_factor> \ # SetAcreepFactorPar
VMDD5102 = <xsteps_zoom> \ # SetXStepsZoomPar
VMDD5112 = <ysteps_zoom> \ # SetYStepsZoomPar
VMDDF122 = <mag_retr_2> \ # SetZRetractMag2Par
VMDDF132 = <mag_retr_3> \ # SetZRetractMag3Par
```

The software flags parameters contains several more parameters:
\#define SW_FSCAN_PHASE 0 /* 1 = return phase signal during f-scan */
\#define SW_MOVEZ_LASTZ 1 /* 1 = use last Z position on line feed */
\#define SW_MOVEZ_ZERO 2 /* 1 = use zero position on line feed, else use $Z \mathrm{~min}$. position
of last line */
\#define SW_CALC_RETRACT 3 /* 1 = calculate z retraction from X/Y */
\#define SW_LSCAN_FULL 4 /* 1 = Tx line scan data during fullscan */
\#define SW_CDATA_FULL 5 /* 1 = Tx control data during fullscan */
\#define SW_CDATA_RETR 6 /* 1 = Tx control data from retraction */
\#define SW_ANTI_CREEP 7 /* 1 = anti-creep scan before fullscan */
\#define SW_AUTO_EXP 8 /* 1 = enable auto-exposure mode */
\#define SW_ACREEP_FULL 12 /* 1 = Tx anti-creep lines during fullscan */
\#define SW_MAGN_PHASE 13 /* 1 = phase signal at magnetic positions */

## Use of Tips

Tip imaging was performed when the imaging quality of a given tip became suspect, or after instrument anomalies that may have resulted in unwanted tip/sample interactions.

The document MID_TIP_IMAGES.pdf provides a list and all images of tips made on the tip imaging target. Due to the limited time available, tip images could not be obtained more regularly. The decision on which tip to use was based partly on these tip images, but also on the requirement to revisit particular target locations, which was found to be challenging when switching tips. Therefore a poor tip was sometimes used in order to perform more accurate positioning.

In addition, the individual properties of some tips (e.g. high vs. low $Q$ factor, magnetic coated or not) led to some tips being preferred for certain scan types.

AUSTRIAN ACADEMY OF ACADEMY OF
SCIENCES

## Reducing tip wear

This work was originally foreseen to develop and calibrate a model of the MIDAS tipsample force. The reasoning for this is that MIDAS carries a finite number of tips (16), whose sharpness must be maintained for the best imaging. It was planned to use the time during the Rosetta "pre-landing" phase to perform this work, but since MIDAS was able to perform scans earlier than anticipated a detailed model could not be constructed before the start of operations.

Based on prior knowledge of AFM and MIDAS operations, a set of operating parameters were selected that were believed to minimise the force. MIDAS operates somewhat differently than a standard AFM in that each pixel is formed by a separate approach between the tip and sample, rather than by sampling a continuously rastering tip. As such, prior to the set-point critically determines how hard and for how long the tip is "tapping" the surface at each point.

Before operation in dynamic mode, a frequency sweep is performed covering the resonance peak of the cantilever in question. Figure 1 shows an example for one of the cantilevers used in the pre-landing phase. Two key parameters are set as a result of this sweep. The driving frequency is set by specifying the working point as a percentage of the peak amplitude (and whether this is below or above resonance). As MIDAS makes a point approach the amplitude is reduced (in tapping mode) from the working point until the setpoint is reached. This is typically kept rather close to the working point so that the interaction duration is minimised.

Figure 1: A frequency scan of cantilever 7, used for the majority of scans post -hibernation until the end of 2014. The blue line represents the peak amplitude, the red line the working point (driving amplitude/frequency) of $90 \%$ peak and the green line is the set-point of $80 \%$. A re-tune threshold of $85 \%$ is given by the dashed line.

This strategy worked very well for the cantilevers used until the end of 2014; since cantilevers with sharper resonances are in principle more sensitive, these were reserved for later use. In early 2015 these high Q-factor cantilevers were first used and several problems were encountered. In fact these cantilevers have resonances that are almost too sharp. As a result small variations in, for example, temperature cause large variations in the amplitude, sometimes providing false triggers of the set-point. This is reflected by distortion in the images and a very noisy cantilever signal seen in housekeeping data.

A working solution to this problem was to introduce several changes:

- reduce the set-point from $85 \%$ to a much lower value of $20-30 \%$,
- increase the dwell- times (the pauses made after each $X, Y$ or $Z$ moves) and
- increase the excitation level (of the driving piezo).

When combined, these changes allow stable imaging with the high Q -factor cantilevers, however the new range of parameters does not allow for further optimisation of the tipsample force.

Figure 2: Tip images of tip 8 from STP 67 (a) and STP 79 (b) revealing no severe change of the tip shape after 10 scans in contact mode at a silicon facet.

It has been observed that the tip wear is only very limited. As can be seen in a comparison of Tip 8 tip images from STP 67 and STP 79 (see Figure 2 (a) and (b) respectively), the tip changed very little, even though 10 contact mode scans have been performed on a silicon facet in between, which apply much more force to the target and the tip than dynamic mode scans. To reduce the applied force of a contact mode scan, one can only reduce the set-point to a lower value. In this case a smaller static deflection is required to give a positive detection of the sample. The first contact mode scans were performed with a set-point (given as the difference from the zero -deflection voltage far away from the
sample) of 0.1 V and this acquired high quality images. The set-point cannot be arbitrarily reduced, however, due to instrumental noise and the finite resolution of the $Z$ piezo. $A$ survey of this parameter was performed by commanding line scans and recording the approach curve (deflection versus distance) at each point. Also two different $z$ step sizes ( 4 and 8) have been tested; since recording the approach curve is limited to 256 points this is the only way to extend the recorded range. With a $z$ step size of 4 and set points of 0.1 and $0.05 \mathrm{~V}((\mathrm{a})$ and (b) in Figure 3) the first contact with the sample is not visible, whereas at 0.025 and 0.001 V , (c) and (d) respectively, both the free cantilever signal and contact with the sample can be seen. When using a $z$ stepsize of 8 the horizontal non-contact regime is observed also for $0.1 \mathrm{~V}(\mathrm{e})$. These tests show that smaller values down to 0.01 V can be used, but at such small values the image quality is affected by falsely triggered points.

(a) Setpoint 0.1 V

(c) Setpoint 0.025 V

(b) Setpoint 0.05 V

(d) Setpoint 0.01 V

Figure 3: Setpoint variation for a z step size of 4 (a-d) and 8 (e-h) on a solgel target revealing a possible reduction of setpoint down to 0.025 V (c) and (g).

The difference in the images of the same tip shown in Figure 3, especially in $Y$ direction can be explained by the change from open loop to closed loop in this direction. When performing contact mode scans on cometary material, a severe modification can be observed, up to a complete disappearance of the particles at the scanned areas. This might be due to the enhanced force applied by the contact mode scans compared to the dynamic mode.

An additional issue was encountered in STP 49 that resulted in severe tip wear, and in fact probably removed the entire tip. A problem in the calculation of the set-point on-board MIDAS resulted in a negative set-point being calculated. MIDAS operates by extending the Z piezo towards the surface at each point until the measured amplitude drops below the set-point (in dynamic mode). Since the RMS amplitude can never be below zero, a negative set-point resulted in the piezo being fully extended at each point, regardless of whether
the tip was in contact with the sample or not. Thus tip 13 was "crashed" into the sample or substrate at each pixel position. This was encountered during a line-scan with control data commanded, such that the approach curve was visible. Figure 4 demonstrates this, proving that the tip did indeed make strong contact with the substrate, resulting in excessive bending of the cantilever.

This was further demonstrated in STP 53 when a tip self-image was attempted using this tip, which aborted after several lines of data showing no tip. The problem was eventually localised to a routine in the on-board software in which 32-bit multiplication was used to convert the commanded set-point (a percentage) into a real voltage value. This issue is not, however, reproducible on the ground, and a temporary solution was designed to patch the OBSW and force the sign bit whenever this multiplication is used, to avoid such problems.

Figure 4: Raw (uncalibrated) control data for a line scan with tip 13 and a wrongly calculated set-point. Note that both the Z position and cantilever DC signals have minimum possible values of -16384, and hence this shows that the piezo was fully extended, resulting in maximum deflection of the cantilever.

## Temperature and Topography

The effect of temperature on the scanning behaviour of the MIDAS atomic force microscope was thought to be one of the major limiting factors on imaging stability and a cause of distortion in the $X, Y$ and $Z$ axes. Indeed the ground- based Flight Spare model of MIDAS shows sensitivity to the laboratory diurnal cycle even when inside a vacuum chamber. This work focuses on attempting to understand these effects by analysing the response of the instrument to both endogenic and exogenic changes.

Four housekeeping temperature sensors are installed in MIDAS: on the preamplifier board, the instrument baseplate, the power converter and at the dust inlet. These temperatures are recorded in the engineering housekeeping packet "HK1", which is sampled every 60s under typical conditions. Additional sensors are mounted on both capacitive sensors (the CSSC) in the XYZ stage, but data from these are only available when the CSSC itself is powered; in the early operations the CSSC was only ON during closed-loop operations.

As a first step the data of these temperature sensors was investigated in terms of module power states; MIDAS subsystems can be separately powered and are switched on or off as needed. As discussed earlier, MIDAS was able to operate earlier than expected. However since power was still limited in this period, MIDAS had to be switched on and off repeatedly. In later mission phases the instrument was left continuously on, apart from periodic reboots after software upgrades or instrument reconfiguration.

In Figure 5 one can see the temperature curves for a reboot performed at the start of STP 45 , taking place during an orbital correction manoeuvre (OCM) when no scanning was otherwise possible. MIDAS was shut down at 23:30 and restart at 23:44 and one can see the large temperature decrease during this period. After switching on again the rest of the OCM was not used for further experiments for safety reasons (except for a frequency scan after the restart to initialise MIDAS). Immediately after the OCM four "approaches" were performed to get the microscope warmed up for the scan (which started approximately at 09:00). An approach refers to movement of the coarse approach stage, a subsystem used to move the microscope close to the sample. This consists of a DC brushed motor housed in a pressurised bellows. This motor drives a spindle, which in turn moves the entire AFM in coarse steps in the $Z$ direction (towards the sample wheel).

The approach stage is a relatively high power subsystem and is used in this case to actively heat the instrument and try to propagate the heat generated throughout the instrument and speed up the thermalisation of MIDAS.

Figure 5: Temperature curves of the four sensors at a reboot at the start of STP 45, showing the decreasing temperature at the left side of the graph at the shut down at 23:30. After the restart at 23:44 only one frequency scan was performed till the end of the OCM at approximately 04:30. For warming the microscope up four approaches were performed till the first scan after the reboot at 09:00, where the temperature gets approximately saturated and allows stable performance.

The temperature variation during a contingency exposure can be seen in Figure $6(a, b)$ at the end of STP 30 and the start of STP 31. In this case all subsystems were powered off, inducing a large temperature decrease recorded by all sensors. The most critical measurement is the preamplifier sensor, since this is closest to the cantilevers. This shows a maximum decrease of $15^{\circ} \mathrm{C}$ for (from $\sim 46^{\circ} \mathrm{C}$ down to $31{ }^{\circ} \mathrm{C}$ ). After this minimum the subsequent switch- on leads to another dramatic increase in temperature. At this point the temperature variation leads to a variation in the scan head in height, which can be seen for the $Z$ piezo HV Monitor in Figure 6 (c) by the red curve. This shows a clear overall increase of the $Z$ piezo voltage from the beginning of the scan to the end, which can be related to a height variation of the scan head and since this is not observed at roughly constant temperatures it may be temperature driven.

Another effect that causes some temperature variation is switching between the two cantilever blocks. There are sixteen cantilevers on-board MIDAS, manufactured in chips of four, with eight cantilevers connected to each of two independent pre-amplifiers. This effect can be clearly seen by plotting the temperatures during STP 35 and the corresponding power status of the two blocks in Figure $7(\mathrm{a}, \mathrm{b})$. The preamplifier temperature increases by switching from block 1 to block 2 and decreases again by switching back. This unwanted behaviour can be avoided by straightforward switching both block on all of the time, since closer to the Sun, power is no longer a limitation.

Figure 5: The blue highlighted area marks the OCMs, the green highlights ongoing scans and the vertical lines in green marks the commanded start of a scan, the blue line marks the end of a correct full scan and the red vertical line is for an aborted scan. The time offset from the green vertical line to the green highlighted area is due to the anti-creep line scans performed before each full scan. (a) Temperatures for STP 30 showing the decrease at the end, when MIDAS was idle. During this STP all scans were aborted due to a contaminated tip, which led to an incorrect approach. (b) showing the STP 31 temperatures with an OCM at the beginning and a scan following. One can clearly see the increasing temperature directly after the OCM is finished. The first scan after the OCM is at a point where the temperature is not yet saturated, which will lead to a failed scan. (c) This graph shows the $X, Y$ and $Z$ piezo HV monitor signal during the first scan after the OCM. The constant $Y$ piezo HV (green line) at the beginning of the scan shows the anti-creep line scans. The X piezo HV shows a very periodic behaviour due to the fast scan axis. The Z piezo HV shows an increasing tendency during the anti-creep line scans and also during the first part of the full scan, but afterwards the $Z$ piezo HV monitor shows a constant value nearly to the abort. The increasing $Z$ piezo HV may be a temperature effect which leads the piezo to extend more and more during heating.

CantBlock1Power

| - baseplate temp | - | converter temp | - dust inlet temp |
| :--- | :--- | :--- | :--- | - preamplifier temp

(a)
CantBlock2Power

(b)

Figure 7: Marked in red is the power status of the cantilever block 1 (a) and 2 (b), revealing a temperature jump by switching between those two, especially at the preamplifier temperature.

Beside these severe temperature variations due to the switching of different modules, at the approach (after the OCM Figure 8) one can observe a small increase in the power converter temperature. Also after a full scan is performed the temperature of the power converter rises approximately $1^{\circ} \mathrm{C}$. As one can see in Figure 8 this increased temperature is only of short duration; at the start of the following scan (each scan is indicated by a green block) the temperature has returned to its previous, stable, value and will not influence the scan. Just before the first OCM block in this STP (marked by blue blocks), one scan gets aborted, due to too little time left before the OCM starts. During the OCM MIDAS is not switched off but only in a safe state with no scans (since there is a risk of damage due to the higher vibration loads during major thruster burns), so there is no severe temperature decrease as can be observed during the reboot. Other such small, in temperature and time, variations can be observed by switching on the approach position monitor (LVDT),
the motor driver power and the wheel motor, but as they are very small and short in time, they do not affect any scan performed afterwards.

Figure 8: Temperature of the four sensors during STP 26 with most of the time used for scanning (green blocks). At the beginning of the first OCM (blue block) a scan gets aborted due to little time left and MIDAS going to a safe state during the OCM. After both OCM a small increase due to the approach can be observed and after each scan the temperature increases also for approximately 1 ${ }^{\circ} \mathrm{C}$.

With almost two years of continuous operations since hibernation, long term trends in the temperature, and their effects, can be monitored. In May 2014, four month after the spacecraft woke up from hibernation, the comet was approximately 4 AU from the Sun. During the nearly two years of observation at the comet the distance decreased to 1.25 AU during the perihelion passage in September 2015 and has been increasing again as the comet and spacecraft depart the inner Solar System (Figure 4 (b)). The four temperature sensors of MIDAS were collecting data with a housekeeping rate of 30s during the entire mission. Thus a long term temperature variation can be observed, which is shown in Figure 9 (a). A general trend following the comet (spacecraft) distance from the sun can be observed, with a maximum mean temperature at perihelion in September 2015 and decreasing temperatures with increasing distances. All four temperature sensors are show increased temperatures of approximately $25^{\circ} \mathrm{C}$ at continuous operation when reducing the comet-sun distance from approx. 4 AU to approx. 1.25 AU . As detailed in the last report, MIDAS operations were possible earlier than originally foreseen, but with some constraints. During far approach phase there was insufficient solar energy available to power the entire payload, and instruments could only be powered for limited times. This can be seen as data gaps in the temperature plots. When switching back on, MIDAS had to heat up again to gain a stable working environment, which must be taken into account during future planning when the increasing solar distance will once again result in instrument time-sharing. Other smaller temperature variations will be discussed in the next paragraphs.

Figure 9: (a) temperature measured at the four temperature sensors during the operational mission since May 2014 to February 2016 and (b) comet - sun distance during the same period, revealing an increased overall temperature trend with decreasing comet-sun distance.

At decreased comet-Sun distance more severe temperature variations could be observed, as seen in Figure 10 (a) which shows the temperatures and geometry during STP079. The strong correlation of the distortion with spacecraft pointing was clearly observed at small comet-sun distances. When the nadir platform is oriented more towards the Sun the temperature sensors show an increase of $2-3^{\circ} \mathrm{C}$ in a very short time, followed by a decrease when pointing is back to nadir. The short delay might be due to the heat dissipation from the illuminated panel to the sensors. Due to this temperature variation, scans performed during these periods are rather distorted, as can be seen representatively in Figure 10 (b). Not only are the $X$ - and $Y$-piezo affected by this temperature induced
distortion, but the Z-piezo sensitivity was also seen to varying strongly with temperature. As a result the $Z$ piezo saturated very easily during these scans. Once this issue was identified, attempts were made to avoid those periods as far as possible without losing too much operational time.

(a) Geometry and temperatures of STP 79

(b) topography image of the $X Y$ calibration target

Figure 10: (a) geometry and temperatures during STP 79 with the green marked time period showing the acquisition time of the scan showed in (b) revealing severe temperature variations during and shortly after near sun pointings. (b) calibration target scan during a near sun pointing revealing very distorted features.

## Open Loop or Hybrid Operation

The XY stage used to position the sample with respect to the cantilever was designed to be used in a closed -loop mode, where the reference signal was provided by capacitive sensors. Unfortunately the X - axis sensor was found to be defective after launch. Thus most scans during the cruise phase were performed in open -loop mode. However, scans in open loop are more susceptible to temperature drifts (as discussed in Temperature and Topology above) and to the non-linear behaviour of the piezos. For this investigation all scans were performed on the X/Y calibration target, Figure 11.

Figure 11: X/Y calibration target. (a) showing an SEM image and (b) revealing the dimensions of this target, which is used for the open loop and hybrid mode comparison.

In order to decide whether or not, and how, to use the remaining CSSC channel, initial tests were performed using the flight spare (FS) model. Scans were first performed with a high aspect ratio of $32 \times 128$ pixels (or vice versa) to check the piezo high voltage (HV) in open loop and again with the remaining CSSC sensors used to control the $Y$ direction in closed loop. Such images were acquired with all possible combinations of the fast scan direction, the direction of the high HV variation - from low to high or vice versa - and the long and short axis.

By comparing these images one can see different behaviours. Firstly some images show strange topography information, which made this analysis very difficult to perform. A comparison of a correct and a distorted image is shown representatively in Figure 12 and Figure 13 ( $a, d$ ). As well as the topography channels (a), the phase signal and the $X$ and $Y$ piezo HV monitor (b, d, respectively) also reveal a clear distortion in the line alignment. In Figure 12 the correct image clearly shows the $X / Y$ calibration standard with the proper additional channels, whereas Figure 13 represents both a distorted topography and all other channels.

Figure 12: representative $32 \times 128$ pixel image in open loop with step size of $15 / 15 \mathrm{X} / \mathrm{Y}$ leading to a $\sim 1.8 \times 7.2 \mu \mathrm{~m}^{2}$ scan of the $\mathrm{X} / \mathrm{Y}$ calibration target for investigation of aspect ratio scans and scan directions with $X$ as fast scan direction and both direction from low to high voltage. (a) topography channel showing the calibration squares, (b) phase channel, (c) X piezo HV monitor and (d) Y piezo HV monitor showing the high voltage in $X$ and $Y$ direction for visualizing the scan direction as left to right for the X direction and as top to bottom for the Y direction.

Figure 13: representative $32 \times 128$ pixel image in hybrid mode with step size of $15 / 41 \mathrm{X} / \mathrm{Y}$ leading to a $\sim 1.8 \times 7.2 \mu \mathrm{~m}^{2}$ scan of the X/Y calibration target for investigation of aspect ratio scans and scan directions with $X$ as fast scan direction and both direction from low to high voltage. (a) topography channel showing distorted line alignment, (b) phase channel, (c) X piezo HV monitor and (d) Y piezo HV monitor showing the high voltage in $X$ and $Y$ direction for visualizing the scan direction and revealing an incorrect image processing of MIDAS.

As mentioned above, no systematic behaviour in terms of a specific parameter could be found by comparing the whole set of images. Neither a change in the fast scan direction, nor a variation in the direction from low to high voltage to high to low voltage was found to be responsible for such a line distortion. A second strange behaviour was observed by comparing the $X$ and $Y$ piezo HV monitor in Figure 14, which representatively show the two channels for two different images. Figure 14 ( $a, b$ ) shows the channels as they should appear: low voltages at the left and high voltages at the right for the X HV monitor and low voltages at the top and higher ones at the bottom for the Y HV monitor signal. As a comparison with figure 2.04 ( $c, d$ ) reveals, a strange shift in both the represented direction and the channels can be observed some images. Also for this behaviour no set of parameter could be found to be responsible for such a flipping.

Figure 14: Comparison of $X$ and $Y$ HV piezo monitor channels of a $32 \times 128$ pixel image in open loop (a) and (b) and hybrid mode (c) and (d) with step size of 15/15 and 15/41 X/Y, respectively, leading to $a \sim 1.8 \times 7.2 \mu \mathrm{~m}^{2}$ scan of the $\mathrm{X} / \mathrm{Y}$ calibration target for investigation of aspect ratio scans and scan directions with $X$ and $Y$ as fast scan direction, respectively. (a) and (b) show the correct HV piezo monitor signal and (c) and (d) show a random flipping of the direction and the channels.

A separate activity was instigated to find the cause of these problems. Eventually it was isolated to a recent upgrade of the on-board software, which introduced a new telecommand responsible for clearing all datasets (rather than the previous method of selecting and deleting individual scans). The bug was fixed, tested on the FS and subsequently uploaded to the FM during an instrument maintenance slot.

Discounting these issues, the procedure and the image acquisition of all sets of parameters gave the intended results, as can be seen in Figure 12 (a-d). By taking the housekeeping (HK) data into account the HV channels were found to work in the expected direction and also the aspect ratio with the small and large axis is checked to be fine for all parameters. Taking all these results together, there are no limitations for the usage of the fast scan axis in $X$ or $Y$ and also the aspect ratio of the scans can be chosen due to optimize time management.

As a next step we investigated image artefacts on $80 \times 80 \mu \mathrm{~m}^{2}$ scans by varying the fast scan direction; the direction of voltage change (low to high, or high to low) was set to a low voltage at the scan start and a high voltage at the end, since previous tests did not show a significant difference. The fast scan direction refers to the direction in which the scanner is moved during a single line in the image. The piezo responsible for the fast axis is therefore exercised repeatedly in an image scan, whereas in the slow direction the piezo makes just a single, incremental, movement. Intuition suggests that distortions are most likely to occur in the slow direction, and that the remaining CSSC channel should be used in this direction, but this had to be tested.

First we concentrated on the open loop due to the fact that nearly all scans performed on the Flight Model post-launch were in open loop mode. As one can clearly see in Figure 15 and Figure 16 there is a severe distortion observable for both scan directions and voltage variation. It is also clear from these images that the tip used for these experiments was rather blunt (see Figure XY for a tip images), however details in topography were not essential here and sharp tips could be preserved for more detailed scans.

Figure 15: Comparison of fast scan direction and piezo voltage direction for $80 \times 80 \mu \mathrm{~m}^{2}$ scans with $256 \times 256$ pixels for the open loop mode with a very blunt tip. In (a) and (b) the image was acquisited with the $X$ fast scan direction and (c) and (d) the $Y$ direction was used as fast scan direction. The voltage was varied from low to high values for images (a) and (c), whereas in (b) and (d) higher values to lower ones were used. All the images reveal a 5-10 $\mu \mathrm{m}$ wide severely distorted area at the beginning of both the fast and slow scan axis, which can be seen in the top left corner for (a) and (c) and in the bottom right corner for (b) and (d).

Figure 16: Comparison of fast scan direction and piezo voltage direction for $80 \times 80 \mu \mathrm{~m}^{2}$ scans with $256 \times 256$ pixels for the hybrid mode with a very blunt tip. In (a) and (b) the image was acquisited with the $X$ fast scan direction and (c) and (d) the $Y$ direction was used as fast scan direction. The voltage was varied from low to high values for images (a) and (c), whereas in (b) and (d) higher values to lower ones were used. All the images reveal a 5-10 $\mu \mathrm{m}$ wide severe distorted area at the beginning of both the fast and slow scan axis, which can be seen in the top left corner for (a) and (c) and in the bottom right corner for (b) and (d).

Beginning in the top left / bottom right corner for the low to high and high to low scan direction, respectively, one can see the severe distortion in both the horizontal and vertical direction. In both directions the first 5-10 $\mu \mathrm{m}$ show the worst distortion, which may be explained by piezo creep. A predominantly non-linearity effect can be excluded since it occurs at all positions of the piezo. A comparison between a representative open loop and hybrid mode image (Figure 15 and 16)reveals a much lower distortion at the scan start and at each line start when using the hybrid mode. As the scan direction and the voltage variation direction does not seem to affect the order of distortion, we have chosen to work from lower to higher voltages for all of the images. A key conclusion from this work package is that the hybrid mode does indeed improve the scan accuracy, even when available in only one channel. This comes at the cost of higher power consumption onboard.

A second very interesting observed effect is that the squares on this calibration target appear as rhombus (diamond- like) structures. Although the alignment between the scanner $X / Y$ axes and the calibration sample is not expected to be perfect, the calibration facets should still show right angled corners and as shown this seems not to be the case. This effect can be more carefully analysed using the hybrid mode images, since in this mode at least one direction is controlled in closed loop which makes it much more regular than the open loop image (this enhancement is clearly seen by the "tilting" of the nominal vertical and horizontal structures in Figure 16 which in the open loop reveals a very different tilt for different $Y$ values, but very similar tilt in the hybrid mode). The effect of diamond like structures cannot be explained by a simple sample tilt not affecting the structure appearing rectangular.

Beside these geometrical distortions the nonlinearity of the piezo can also be observed by looking at the lengths and widths of the squares, which should have a periodicity of $3 \mu \mathrm{~m}$ (e.g. left edge to left edge). Measurements at different positions for the open and hybrid mode images with the $X$ direction as fast scan direction reveal a strong enlargement at the top left corner and also a strong reduction in the bottom right corner, which is also a result of piezo creep. Distortion in the intermediate zones is also observable, where in one direction enlargement and in the other direction a reduction occurs. These observations show that the effect of the piezo creep and the piezo nonlinearity can not be fully separated. Table 1 and Figure 17 show the measured values and positions and different zones of enlargement and reduction. In Figure 17 ( $c, d$ ) four different line cross sections are shown, which reveal the strong distortion very clearly. The measured values of the calibration standard structures are marked by vertical lines and given in Table 1. sCIENCES

Table 1: Measured values of the calibration standard structures for open loop and hybrid mode horizontal (profile 1 and 2) and vertical (profile 3 and 4) revealing (i) in blue an increased structure length at the start of each line and image, (ii) in red a decreased structure length, mainly at the open loop at the line and image end and (iii) in green the correct structure dimensions dominating at the hybrid mode.

These show that using the hybrid mode with the closed loop in the $Y$ direction results in a reduction of the distortion and of the variation of the calibration structure's dimensions in this direction. In conclusion the hybrid mode should be used in the slow direction for future scans on the Flight Model. However, some distortion will remain and this very complicated behaviour makes it practically impossible to define one calibration value in each direction and another strategy has to be found to correct these distortions and calibrate the image in a reproducible way.

(a)

(b)
(c)

(d)

Figure 17: In (a) and (c) open loop topography image and line cross sections and (b) and (d) hybrid mode topography image and line cross sections are shown for revealing the different dimensions of the calibration standard structures.

By looking at the calibration standard scans in the previous figures one can see a clear distortion at the start of each scan and at the start of each line.

One way of eliminating the incorrect calibration factor would be to simply use periodic scans of the calibration structure to update the static calibration factor, but this would not lead to a correction of the distortions at the line and scan start. Distortion correction algorithms were tested, but no systematic method of applying distortion correction to FM data was found.

## Tip Shape Deconvolution

An AFM scan is effectively a convolution of the surface and the tip shapes and hence tip convolution artefacts are one of the most important errors. Since the AFM tip cannot be fabricated as an ideal delta function (which would be an ideal tip shape) a certain degree of image distortion can always be observed, depending on the relative size of the tip and sample. While scanning sharp features on the surface it is actually possible to see an image of the tip instead of the real surface. As we will see later, this effect can be used intentionally to investigate the tip shape.

A literature study reveals different methods to find the tip geometry, which then be used to either build a certainty map (showing where the sample was touched by a single part of the tip) or potentially to remove the errors via deconvolution. First of all one can use the manufacturer's specifications of the tip geometry, typically parameterised by the apex radius and angle. A second useful method is to determine the tip properties with an independent technique, such as electron microscopy. Clearly this latter is not possible for an instrument millions of kilometres from the Earth. SEM images were made of all tips before launch but these do not fully constrain the three dimensional tip shape and cannot be repeated in flight. The approximate shape and dimensions of the tips are known; they are approximately a pyramid with a $\sim 10 \times 10 \mu \mathrm{~m}^{2}$ base and a height of $\sim 10 \mu \mathrm{~m}$. A representative SEM image of a tip is shown in Figure 18 (a-b). One issue during fabrication was that the intended four sided pyramid in the end looks like a 3 sided pyramid. This shape is a result of either slight overarching of one or two crystal faces or a different orientation of the silicon wafer, such that not all faces etch with the same efficiency. Thus our tips are shaped like a truncated knife-blade, which can be seen in Figure 18 (a) and a representative final tip is shown in Figure 18 (b). These images cannot be used to accurately specify the tip radius or the apex angle due to the insufficient resolution and the limited viewing angle.

Figure 18: SEM images of the AFM tip before (a) the last etching step and (b) the final version of one tip at the flight model, revealing the tip shape to be formed out of a knife blade form to the final sharpness.

A third method for finding the tip geometry is to use a tip characterizer sample structured with spikes having a higher aspect ratio than the AFM tip. Both the Flight Spare model and the Flight Model are equipped with such a sample, an SEM image and schematic of which can be seen in Figure 19.

Figure 19: Tip imaging sample mounted at both the flight spare and the flight model. (a) SEM image and (b) schematic illustration showing the dimensions of the sharp tips used for imaging of the AFM tip.

As these tips have an apex angle of approximately $30^{\circ}$, they are (at least at the top part), sharper than the tip used for imaging. They are approximately 700 nm high, which limits the ability to characterize the AFM tip to this topmost area. Tip images of the flight model are shown in Figure 20 for different tips. As one can clearly see, all of them show a more or less triangular shape. As well as confirming the shape shown in the electron microscope images one can readily see the different states of tip wear. Since tip 11 had not been used for many scans, it is in very good condition (no obvious "double- tip" features, for example), whereas tip 5 shows attached particles and deformation of the tip. In this image one can also see one problem, which arose after tip 5 scanned unexpectedly high particles (and hit them from the side), of varying image quality and tip- sample interaction from top to bottom. Further contamination and abrasion can be observed for the tips 9 and 7, which are no longer usable for high quality scanning but can still be used for calibration purposes, for locating particles and for measuring statistical properties of particles, such as their height, that are not affected strongly by the tip artefacts.

In Figure 21 (a) and (c) one can see topographic images of small particles acquired with tips 7 and 9 respectively, showing an obvious convolution of the tip shape with the real particle shape. The particles have a size of approximately $2-4 \mu \mathrm{~m}$ and a height of $\sim 2 \mu \mathrm{~m}$ and $\sim 450$ nm , respectively. In fact these sizes are very suitable for high resolution measurements and due to the fact, that there are sharp tips left, the ability to image the same area/particles with different tips gets essential.

Figure 20: Tip image of tip 11, 5, 9 and 7 . In (a) tip 11 shows nearly no wear and a very sharp and uncontaminated tip. Tip 5 (b) is contaminated with a few particles, but some change in image quality from top to bottom can be observed here. Tip 9 (c) shows a plateau and a blunt tip. Tip 7 (d) shows the most contaminated and worn status.

With these tip images one can use the algorithm published by Villarrubia (1994) to reconstruct the least upper bound of the real surface, which can be seen in Figure 21 (b) and (d). As one can see in both cases, the lateral dimension of the particles get confined, which is in good agreement with the algorithm of deconvolution. But especially in the corrected image with tip 7, shown in Figure 21 (b), one can see artefacts induced by this method. First of all the height of the particle should stay the same and not be decreased from $\sim 2.2 \mu \mathrm{~m}$ to $\sim 1.5 \mu \mathrm{~m}$. The challenge is to find the right dimensions of the tip image to be used in the reconstruction. If the cropped tip is too large, the deconvoluted surface features severely decrease their height, whereas for a smaller section of the tip image, some features get cut off and not considered.

Figure 21: Topography image of a cometary particle with tip 7 (a) and with tip 9 (c). The particle size is in both cases in the order of $2-4 \mu \mathrm{~m}$ and the size is from approximately 450 nm to $2 \mu \mathrm{~m}$ for the particle in (c) and (a) respectively. (b) and (d) show the deconvoluted image where the tip was taken from figure 3.03 . Both show a decreased structure height and other artefacts.

The second interesting feature which can be observed, is that an additional step arises due to the surface reconstruction. This step has approximately the height of the tip, which we get from the tip image. Figure $22(\mathrm{a}, \mathrm{b})$ show cross sections of the large particle from the image in Figure 21 (a) and (c) - note the different scale in height. The height of the steps in the cross section of the corrected image are in the order of 600 nm , very similar to the tip height.

Figure 22: Line cross sections of the uncorrected (a) and corrected (b) particle showing a decreased particle height and an additional step induced at the post processing.

The tip imaging sample, which is used for visualization of the tip shape and its contamination, has only 700 nm high spikes, and thus only the top of the $\sim 10 \mu \mathrm{~m}$ high tips can be imaged. With this limitation, and the fact that nearly all the particles are higher than this 700 nm , it is clear that a full deconvolution is not going to be possible. In addition, when the tip hits the sample the tip shape can change dramatically between each tip image and that it cannot be excluded that the shape is even different in between these tip images, is limiting the applicability of a tip deconvolution algorithm. For typical, rather flat, AFM samples the tip apex shape is most important. For the large cometary particles that MIDAS has encountered, the entire tip shape plays a role.

The more limiting factor in terms of tip shape seems to be contamination with dust particles during scanning. As can be representatively seen in Figure 23 by different tip images of tip 9 , the amount of contamination is changing with time and thus the tip shape varies considerably. Sometimes the contamination seems to disappear, which can be observed between STP 42 and STP 47, which looks much cleaner than the previous tip image. This is probably caused by either the permanent oscillating behaviour of the cantilever (the whole array is vibrated, not just a single cantilever) or intentional frequency sweeps at the highest excitation levels, which leads to greater amplitudes, increasing the chances to get rid of the unwanted contamination. Later images of tip 9 show even more severe contamination due to scanning over exposed areas with a large amount of cometary material. Also this large amount of contamination is limiting the capabilities of a deconvolution, since it is very likely, that the tip shape is changing in between each scan to some extent.

Figure 23: Tip 9 tip images from diverse STPs revealing a different amount of contamination, but tip wear seems not to be dominant.

## Tip Resonance

MIDAS has 16 tips/cantilever installed, which are fabricated in the same way and thus should be very similar. As can be seen in Table 2, there are small differences in the resonance frequency, but a larger variation can be observed in the Q -factor, which is the resonance frequency divided by the half-width of the resonance peak. A higher Q-factor indicates a more sensitive cantilever, since a small shift in resonance frequency, when interacting with the surface, induces a large amplitude change.

| Tip number | Resonance frequency [Hz] | Q-factor |
| :---: | :---: | :---: |
| 1 | 83760 | 10340.74 |
| 2 | 84339 | 10542.38 |
| 3 | 84262 | 10943.18 |
| 4 | 89826 | 744 |
| 5 | 81807 | 2399.04 |
| 6 | 83254 | 363.08 |
| 7 | 88487 | 100.65 |
| 8 | 93374 | nan |
| 9 | 108705 | 224.09 |
| 10 | 85518 | 3734.42 |
| 11 | 86574 | 2905.20 |
| 12 | 95356 | 166.16 |
| 13 | 84748 | 4631.07 |
| 14 | 84165 | 5163.50 |
| 15 | 83695 | 4923.26 |
| 16 | 893494 | 5108.28 |

Table 2: Tip resonance frequencies and Q -factors from thermal vacuum data at $15^{\circ} \mathrm{C}$.

In our case the values vary from approximately 100 up to above 10,000 . In the first months of the mission the cantilevers with a rather low Q-factor, such as tip 7, and with an intermediate Q -factor, such as tip 5 , were used, since it was desired to save the more sensitive cantilevers, and those with magnetic coat (1-4) to perform high resolution
measurements of located dust particles. Comparing representative images in Figure 8 (a, b) of tip 7, as a low Q-factor tip, and Figure 24 (c, d) tip 5, as an intermediate/high Q-factor tip, one can clearly see that the higher Q -factor is somehow distorted to the right half, which can be seen in the topography scan, but much better in the phase image. This strange behaviour can only be observed for larger scans, such as the $80 \times 80 \mu \mathrm{~m}^{2}$ scans shown here. Reducing the scan size to e.g. $20 \times 20 \mu \mathrm{~m}^{2}$ results in nearly undistorted scans. Since MIDAS is an amplitude modulated atomic force microscope, the key difference between the high and low $Q$ cantilevers is the response of the amplitude to frequency shifts. It has been observed throughout the mission that temperature changes can cause shifts in the resonance frequency, and hence amplitudes. To reduce this effect, a frequency re-tune at every line was enabled, which forces a sweep of the resonance peak and re-calculation of the operating parameters at the end of every line. Whilst this is helpful, it also increases the scan duration (a full eight- cycle frequency scan can take up to three minutes, and a scan can have up to 512 lines).

Figure 24: Comparison of tip 7 ( $a, b$ ) and tip 5 ( $c, d$ ) topography and phase channels, revealing a distorted scan with the higher $Q$-factor tip 5 at the right half of the scan. The phase image is showing a severe transition from the left half of the image to the right.

Thus, as a next step to improve the image quality of the high Q-factor cantilevers, the scan parameters, in particular the set point and the working point, were adapted. To achieve a more stable regime, the working point was reduced from $-90 \%$ down to $-45 \%$ of the resonance amplitude (the negative means that the frequency is set to match the corresponding amplitude below resonance) and the set point was moved to a correspondingly lower value of $25 \%$. Moving these values away from the peak of the resonance curve results in a smaller dependence of amplitude on frequency, and hence the cantilever is less sensitive to thermal and other drifts (but also, of course, less sensitive in general). A scan with these parameters with tip 14 can be seen in Figure 25 (a, b), which shows an $X / Y$ calibration standard scan. This scan shows nearly no distortion in the topography image, and also the phase signal seems to be more stable, except for a small drift towards lower phases from the beginning of the image to the end. The plots of the resonance frequency with the default and updated set of parameters is shown in Figure 25 ( $c, d$ ). As one can clearly see, the width of the peak is very narrow at the default parameter (c) working point, whereas it is clearly increased for the new set of parameters (d). As can be seen in the AFM image in $(a, b)$ this is clearly stabilizing the image quality and thus this set of parameters is used as default for the cantilevers with a high Q-factor. SCIENCES

## Cantilever Positioning

The reproducibility of scan positions is critical to allow follow--up of images weeks or months in the future, and to allow different cantilevers to image the same part of the target. It became clear during the mission that there were several difficulties in re-positioning cantilevers with high accuracy. Firstly, some scans that were commanded to the same position did not show the same part of the target, despite the fact that all telemetry indicated that the cantilever should be positioned correctly. The only plausible cause for this is an issue with the sample wheel. Indeed it has been seen that the wheel sometimes "sticks" - it either fails to start moving, or else moves too slowly to find its reference position before a software time-out is triggered. To try and avoid this, an on-board software upgrade was added to re-attempt wheel moves should the timeout be encountered.

A second issue was encountered when switching cantilevers. The sixteen cantilevers are arranged on a linear array. To provide coarse $X$ positioning and to choose a cantilever, the sample wheel is mounted on a linear stage. Thus to image the same part of the sample with a different cantilever, the wheel must be accurately moved along its axis by the distance between the two cantilevers. Ground calibrated values for the linear stage position to centre the cantilever on the wheel were used in the first part of the mission, but were found to be insufficient to re-position the linear stage to switch cantilevers within the field of view of the XY stage. Thus, at a first point, a linear stage re-calibration exercise was performed.

Figure 25: Topography (a) and phase (b) calibration standard image with high Q-factor tip 14, revealing the updated parameters to improve the image stability and thus the quality. (c-d) are showing the resonance peaks with the parameter settings marked by the horizontal lines for the default parameters (c) and the updated 'high Q' parameters (d). The vertical lines show the frequency at the working and setpoint, revealing a much wider window at the 'high Q' parameters, indicating to be much more stable against frequency shifts.

Figure 26: Topography scan of a noticeable structure, which was found at the $Z$ calibration target at the end of the linear grid and used as a marker position to re-calibrate the linear stage.

| Tip number | X offset ( $\mu \mathrm{m}$ ) (from centre) |
| :---: | :---: |
| 1 | 350 |
| 2 | 365 |
| 3 | 375 |
| 4 | 390 |
| 5 | 365 |
| 6 | 370 |
| 7 | 370 |
| 8 | 345 |
| 9 | 285 |
| 10 | 270 |
| 11 | 275/290 |
| 12 | 285 |
| 13 | No tip |
| 14 | 295 |
| 15 | 330 |
| 16 | No tip |

Table 3: Measured $X$ (from the facet centre) and $Y$ (from tip 9 position) offsets.

A position on the $Z$ calibration target was found, which served as a marker for the real position. This marker position was at the edge of the linear grating, where a contamination feature was found (see Figure 10) that provided an additional reference. Line scans with each tip were then performed at various linear stage positions to find this feature. The position of the edge was measured from the nominal centre position and should be at the same value for each individual tip. As Table 3 reveals, the measured offsets were sometimes greater than $100 \mu \mathrm{~m}$. Since typical scans were 40 or $80 \mu \mathrm{~m}$ square, this confirms why the position was not repeatable when switching between some tips. The
derived offsets were implemented in the planning code and as a result cantilevers switching was found to be very repeatable.

Figure 27: tip 10 (top left) and tip 15 (top right) scan of the edge finding feature, revealing a correct offset in $X$ direction, but showing an offset in $Y$ direction of approximately $15-20 \mu \mathrm{~m}$. The bottom illustration is showing the X corrected positions, but the nominal Y position is still showing the same value, which is clearly not the case when looking at the two scans.

## Other Key Operational Findings

- Always powering both cantilever blocks helps cantilever stability, usually only the active block is powered.
- Instrument should be thermalized prior to scans, when switched ON/OFF image distortions can be severe.
- Running the coarse approach mechanism and waiting some hours can help with this, this generates excess heat, but time is needed for thermal wave to reach cantilevers.
- Hybrid mode (using the remaining CSSC channel) is essential for best imaging and closed loop operation is best applied to the slow scan direction.
- Even using hybrid mode, some distortion/nonlinearity remains this distortion can be corrected by applying a polynomial correct after scanning the XY calibration target this method also calibrates images correctly into physical units.
- The previously assumed origins for open and closed loop are not identical, 4 corrections have been performed by recording and fitting to HV channels.
- Tip imaging by itself provides an excellent measure of tip wear blind tip estimation can help, but is difficult to optimise.

## Summary of STPs

Operational planning of Rosetta instruments takes place on four different time scales. The key timescales for MIDAS are the Medium Time Planning (MTP) cycle in which resources such as power, data and spacecraft pointing are assigned, and the Short Term Planning (STP) cycle in which detailed instrument operations (i.e. individual telecommands) sequences are derived, checked and uploaded. Each MTP covers a period of about one month and each STP typically one week; both are numbered sequentially from the hibernation exit. Appendix A gives a list of dates and times of each STP start and end, and which STPs are contained in each MTP. Appendix C contains a glossary of common terms and acronyms used in this report.

Here follows a summary of all STPS from the comet escort and extended mission phases. All image scans per STP are listed in the summary tables found at the end of the document. Image scans are referred to by the STP number and the scan number in the summary tables, e.g. STP093-1.

## STP003

## Planning:

1. Scans of $X Y$ calibration target, main scan $X$ and main scan $Y$ main scan direction in $X$ failed scan, main scan in $Y$ direction completed.
2. Prescans different targets.

Completed this STP

## Additional Notes:

## STP003-1: RO-D-MIDAS-3-PRL-SAMPLES-V3.0/ IMG_1413214_1415411_001_ZS

Scan failed, Z piezo continually extends during creep avoidance, and get saturation. Also cantilever amplitude increases dramatically, possibly with temperature.

STP003-2: RO-D-MIDAS-3-PRL-SAMPLES-V3.0/ IMG_1413214_1415411_002_ZS
Odd imaging. Repeat in a later STP.
STP003-3: RO-D-MIDAS-3-PRL-SAMPLES-V3.0/ IMG_1413214_1415411_003_ZS
Cantilever tuning failed causing aborted scan.
STP004-9: RO-D-MIDAS-3-PRL-SAMPLES-V3.0/ IMG_1413214_1415411_009_ZS
Frequency threshold not found, scan failed.

## STP004

## Planning:

Prescans various targets.

## Additional Notes:

STP004-2: RO-D-MIDAS-3-PRL-SAMPLES-V3.0/ IMG_1413214_1415411_016_ZS
Failed due to frequency scan fail.
STP004-3: RO-D-MIDAS-3-PRL-SAMPLES-V3.0/ IMG_1413214_1415411_018_ZS
$Z$ piezo has reached maximum extension at end of image.

Figure 1. Z piezo extension (y axis in raw instrument values) during scan STP004-3, showing Z piezo reaching maximum extension towards the end of the scan.

STP004-6: RO-D-MIDAS-3-PRL-SAMPLES-V3.0/ IMG_1413214_1415411_024_ZS
Scan completed. Clear contamination features. Odd height feature at centre of scan, likely due to particle stuck to the tip during scanning the central region causing change in retraction height of $Z$ piezo.

Figure 2. 3D image of STP004-6 showing odd height feature at centre of target and contamination features.

## STP005

## Planning:

Re-image particle seen in STPO29. Exposure.

## STP034

## Planning:

Resonance frequency check of all cantilevers ( 2 Hz coarse step). Continued exposure.

## STP035

## Planning:

Start scanning (before exposing target) areas on target 12 with tip 7 . Try to image and/or clean cantilever 5 using tip calibration target.

## STP036

## Planning:

Continue scanning areas on target 12. Try to image and/or clean cantilever 5 using tip calibration target.

## STP037

## Planning:

Repeat scans from STP033. Expose target 12.

## STP038

## Planning:

Continue exposure. Repeat target 12 overview scan with cantilever 9 . Repeat $80 \times 80 \mu \mathrm{~m}$ scan of the two-particles on facet 10 with cantilever 5 .

## STP039

## Planning:

- Complete scanning areas on target 12.
- Leave 5 hours for OBSW upgrade.
- Repeat frequency survey with updated frequency calculation.
- Re-image STP036-4.

## STP040

## Planning:

- Expose target 12.

## STP041

## Planning:

- Expose target 11.
- Repeat STP038-1.

## STP042

## Planning:

- Tip image of cantilever 7
- XY calibration, tip 7
- Amplitude calibration at different excitation levels.
- Pre-scan of a new target, using cantilever 11

## STP043

## Planning:

- Expose before and during closest approach
- target 11
- Scan target 11 with cantilever 11
- area pre-scanned in STP042
- Tip calibration scan of tip 11

## STP044

## Planning:

- Following from STP041
- seen $\sim 4$ particles of $\sim 400 \mathrm{~nm}$ height to follow-up
- target 12, tip 9
- Pre-scan target 14
- Expose target 14 around zero phase / CA

## STP045

## Planning:

- Reboot during OCM
- Prepare cantilever 10
- amplitude calibration (control data)
- tip calibration
- Use cantilever 10 to pre-scan a new facet - facet 13

## STP046

## Planning:

- Following from STP043 (exposure during closest approach, failed scans) and STP042 (odd tip 11 behaviour)
- Investigate cantilever 11
- multiple frequency scans with same extent, and only 6 cycles
- repeat failed amplitude calibration
- repeat NC scans
- check behaviour of $Z$ piezo
- Profile cantilever 13
- frequency sweeps
- amplitude calibration
- tip image
- repeat pre-scans of facet 11

## STP047

## Planning:

- Linear stage calibration (move to min and max positions, record LVDT)

Completed this STP

- Tip image of cantilever 9 high and low resolution

Completed this STP

- Follow-up of exposure in STP044

Completed this STP

- Linear stage calibration with adjusted retraction height Completed this STP
- Expose facet 14

Completed this STP

## STP048

## Planning:

- Repeat facet 13 pre-scan with cantilever 10, higher excitation level
- Repeat tip image with cantilever 10, excitation turned up
- Expose target 13 (2 days)
- Pre-scan large area of facet 6 at high resolution with cantilever 10 , high excitation, before zooming at centre
- Attempt to find fluffy particle with cantilever 7 target 12

## Additional Notes:

STP048-1. RO-C-MIDAS-3-ESC2-SAMPLES-V3.0/ IMG_1506923_1508813_018_ZS

Frequency scan at the start:

Now looking at the cantilever AC value during this scan:

It looks as though the amplitude is often going through resonance. Either the resonance frequency is drifting, or the driving frequency is not stable... Possible ways to improve:

- if it is transients, increase the dwell times (currently default 50 ms )
- decrease the set point (make a more "solid" contact)
- set frequency re-tune every line

## ROSETTA-MIDAS-Analysts Notebook

Document Version : 1.0

In any case we can look at the frequency scans so far to estimate what drift that could cause:

STP048-2. RO-C-MIDAS-3-ESC2-SAMPLES-V3.0/ IMG_1506923_1508813_020_ZS
Tip image, also using higher excitation and start frequency
Scan worked OK - one re-tune in the middle. Crop of the second half:

Clearly this is in some way reflective of the tip shape, but the image is very noisy and the height is very small.

## Lessons learned:

1. 22 frequency scans with cantilever 10 and no glitches - seems that setting the start frequency first helps
2. now set as the default in future planning
3. all scans with cantilever 10 useless due to high Q -factor and "jitter" in resonance curve

## STP049

## Planning:

- Repeat linear min/max test
- this time enable the linear LVDT power after the move
- Repeat of NC approach curve (failed twice), cantilever 11
- Control data of cantilever 13 (no good curves until now) with decreasing set point
- Control data of all unused cantilevers at all usable excitation levels
- Prescan target 11
- Expose facet 11

## Lessons learned:

Increasing excitation helps for some cantilevers, but for most high $Q$ will have to decrease setpoint
No change in the absolute movement of the linear stage as measured by the linear LVDT

## STP050

All operations lost due to spacecraft entering safe mode.

## STP051

## Planning:

- Switch on after safe-mode
- Frequency scan with cantilever 6 to initialise subsystems
- Four line scans approach aborting before surface - to warm up
- Tip scan of cantilever 7
- Scan facet 13 with cantilever 7
- have been exposing this during OCMs
- no good recent pre-scans
- Repeat with cantilever 10
- not only set start frequenct and reduced set point, but frequency retune every line and with settles time increased
- Expose facet 13

## STP052

## Planning:

- Control data tests of cantilever 5 (all useable excitation levels)

Completed this STP

- Scan of the "first" found with cantilever 5 to check state
- using new functionality - large re-tune window, set frequency first, then lower setpoint
Completed this STP
- Line scans of height calibration with cantilever 5 for linear stage calibration Wrong target was commanded
- Scan of $X Y$ calibration target with cantilever 10
- Large XY calibration target scans (small ones in STP051)
- Scan some of facet 14 (already exposed) with tip 14

## STP053

## Planning:

- Repeat height calibration edge finding with correct facet
- cantilever 6 (to compare with PC4)
- cantilever 5
- cantilever 7
- cantilever 9
- Repeat largest STP041 particle + feature vector
- covering larger area to find particle
- cannot be too large or else frequency vector won't work so well
- expanded to $\sim 25 \mu \mathrm{~m}$ width
- Tip image of cantilever 13
- looks like there is no tip left
- Repeat coarse overview scan of facet exposed during safe-mode
- lower safety factor, lower setpoint, increased dwell-times
- Repeat the scan of particles seen with cantilever 9
- with reduced retraction accounting for known particle heights
- Repeat again with smallest linear stage offset
- using $1 \mu \mathrm{~m}$ ( $5 / 6$ times the smallest step)
- Coarse scan of facet 6 (silicon)
- with cantilever 10, low set point
- before we do a zoom in (before exposure)

## STP054

## Planning:

- Re-scan STP-47-3
- saw two particles before - one possibly outside of pre-scan range?
- cantilever 9
- and run the feature vector
- Expose facet 13 during closest approach
- Pre-scan of target 21 with cantilever 10
- Scan facet 12 with cantilever 10

## STP055

## Planning:

- re-scan facet 14 with cantilever 14 (to investigate these odd features)
o follow-up to STP052 scan
o increase the dwell times to 100 ms
o and check if particle was seen in pre-scans
o if not try a zoom (with frequency vector)
■ frequency vector to look for feature with $>50$ points, $300 \%$ zoom
- ran with step size of 1
- no obvious features
- lots of frequency re-tunes
- line calibration scans based on results from STP053
- cantilever 6 - going to negative LVDT values (find the other edge)
o cantilever 6 - use the case where we found the pattern edge, shift by ~10/20 $\mu \mathrm{m}$
o cantilever 5 - repeat with increased dwell, reduced setpoint
- also further in the positive direction +400

■ check approach and set app_max
o cantilever 7 - extend in the positive direction to $+400 \mu \mathrm{~m}$

- cantilever 9 - repeat +200 scan (think we've found the edge)
o repeat for $10,11,14$
- make sure to add "high Q" parameters
- repeat facet 11 with cantilever 14 pre-scan to check for particles after safe mode exposure

O assuming no large particles "hidden" by odd features

- Repeat XY calibration with tip 10 (from STP052)
- but using increased dwell-times
- Failed
- Scans with cantilever 7 target 12 outside of area where we have already found particles
- but have pre-scans - same linear positions

## STP056

## Planning:

- Reboot instrument
- Completed
- Tip image of cantilever 9
- Completed-distortion due to reboot
- XY calibration tip 14
- Repeat cantilever 9, facet 12 scan
- Test for wheel rotation - using the XY calibration sample with tip 9
- run 3 times, with no linear stage shift between calls, rotating wheel several times between scans to test for changes in accuracy of positioning
- Target 10, tip 7 re-scan STP033-2

## STP057

## Planning:

- Tip image tip 5, repeat scans from STPs $53,54,57$

## STP058

## Planning:

- OBSW upgrade - 5 hours starting at 09:30 onboard
- Tip image of cantilever 10
- Follow-up of STP054-4
- Repeat line scans showing odd slopes with control data enabled
- Repeat XY calibration scan with cantilever 10 (from STP052) with increased dwell times - repeat of failure in STP055

AUSTRIAN ACADEMY OF ACADEMY O
SCIENCES

## STP059

## Planning:

- Line scans in $Y$ to investigate possible wheel movement problems
- Look at cantilever repositioning without wheel movement
- now we know the exact offsets from the line scans, using the edge of the height calibration sample
O e.g. cantilevers 6 and 7 - both with offsets of $\sim 370 \mu \mathrm{~m}$
- Failures in STP055 and STP056 - repeat
- e.g. - Scan centre of facet 11 with cantilever 14 - exposed in safe mode, odd coarse scan, but not obvious large particles
- but avoiding WOLs
- Contact mode approach and line scan test
- Failed
- Pre-scan of target 21 with cantilever 10
- Failed

## STP060

## Planning:

- Frequency scans with phase for all cantilevers
- Scan with a high Q cantilever with LVDT switch on
- add extra command between approach and full scan start
- use facet 11 with tip 14 - low res, same as STP057
- switch control data on for this image
- enable with instrument setup AND in the full-scan command
- Follow up of STP054-2
- tip 9 , target 14
- zoom on particles
- Line scans with high Q cantilevers + control data to check for low excitation/WP/SP combinations
- find new set of default parameters to give good scans and reduce tip wear

## STP061

## Planning:

- Repeat tip 16 edge finding with different parameters
- repeat of STP058 where "contrast" decreased over lines
- Tip image of cantilever 10
- repeat of STP058 post OBSW
- Repeat lines scans from STP058 (odd slopes, with control data; varying parameters)
- failed due to new sw_flag
- Repeat XY calibration with cantilever 10
- ran in STP058, but strange contrast change again
- Repeat STP059 line scans to investigate wheel movement
- failed in STP059 due to sw_flag
- Repeat contact mode scans - line + control + images
- for image use repeat of STP059 "repeatability" scans with cantilever 9
- XY scan of cantilever 10 ? With threshold mode?
- Image scan of height calibration edge with difference cantilevers to check location finding, expanded in $X$
- previously $64 \times 128$ scan $(40 \times 80 \mu \mathrm{~m})$ in STP059

## STP062

## Planning:

- Repeat STP060-2 do we see the same particles
- XY calibration scans
- Pre scans of new facet with new tip
- facet 22, tip 10
- hybrid mode and main scan Y
- Scan facet 13 (exposed in recent STPs)

## STP063

## Planning:

- Repeat 10x line scans in $Y$ to check for wheel issues
- failed in STP061 since app_max was set to 0.0
- REMOVE LINEAR STAGE MOVEMENTS
- Repeat contact mode line scan with control data
- failed last time due to abs approach after setup in ITL template
- Image target 10 with cantilever 5
- repeat of failed scan in STP060
- Repeat of tip image of cantilever 14
- failed in STP060
- Repeat some of the cantilever 14 line scans with a lower
- to avoid saturation and hunting
- Repeat 16 edge finding - again?
- with what new parameters + ve working point
- even lower working point?
- Second facet pre-scanned with another tip
- -> to get into a 2 branched scheme again at some time
- cantilever 14 , target 21

## STP064

## Planning:

- Repeat large scan showing two particles (follow ups that failed in STP062)
- Edge finding with cantilever 8 (contact mode)
- Edge finding with magnetic cantilevers (1-4)

## STP065

## Planning:

- Contact mode approach and line scan with control data (failed in STP063 due to bad template)
- Repeat scan of target 10 with cantilever 5, follow-up to STP052 and STP060 and STP063
- Frequency survey of all cantilevers using new coarse and fine step sizes
- $80 \times 80 \mu \mathrm{~m}$ scan of target 21 with cantilever 14 , mainscan Y , hybrid mode. Offset 128 $\mu \mathrm{m}$
- Diagnostic scans of facet 11 with cantilever 14 , various retraction heights and settle times
- Scan of target 10 with cantilever 10 (originally scanned with 5), tip offset $250 \mu \mathrm{~m}$
- $80 \times 80 \mu \mathrm{~m}$ scan of target 21 with cantilever 14 , mainscan Y , hybrid mode. Offset $128 \mu \mathrm{~m}$
- $80 \times 80 \mu \mathrm{~m}$ scan of target 12 with cantilever $10,-50 \mu \mathrm{~m}$ tip offset
- $80 \times 80 \mu \mathrm{~m}$ scan of target 12 with cantilever $10,-114 \mu \mathrm{~m}$ tip offset
- $80 \times 80 \mu \mathrm{~m}$ scan of target 12 with cantilever $10,-178 \mu \mathrm{~m}$ tip offset
- $80 \times 80 \mu \mathrm{~m}$ scan of target 12 with cantilever $10,-242 \mu \mathrm{~m}$ tip offset

## Additional Notes:

## 2015-07-15 13:25:00 : Frequency survey of all cantilevers using default parameters

## STP066

## Planning:

- Follow-up scan STP058-2
- Tip calibration scans
- Coarse scan of facet 13
- Pre-scans of facet 22 and 21

## STP067

## Planning:

- High resolution edge finding scans ( $5 \times 20 \mu \mathrm{~m}$ lines with 39 nm /pixel resolution per cantilever) - tip 6
- Repeat scan of target 10 with cantilever 5, follow-up to STP052, STP060, STP063 and STP065
- FAILED, Frequency scan resulted in amplitude too low
- Tip 9 pre-scan of target 5
- High resolution edge finding scans ( $5 \times 20 \mu \mathrm{~m}$ lines with 39 nm /pixel resolution per cantilever), tip 5
- $4 \times 4$ tile scans with tip $14,32 \times 32$ ( $40 \times 40$ microns) each
- High resolution edge finding scans - tip 7
- Tip image in contact mode (tip 8)
- Cantilever 16 line scan of the height calibration sample testing +45\% WP
- High resolution edge finding scans ( $5 \times 20 \mu \mathrm{~m}$ lines with 39 nm /pixel resolution per cantilever) - tip 8
- High resolution edge finding scans ( $5 \times 20 \mu \mathrm{~m}$ lines with $39 \mathrm{~nm} /$ pixel resolution per cantilever) - tip 10
- Scan of target 10 with cantilever 10 (originally scanned with 5), tip offset $250 \mu \mathrm{~m}$ tuning centre
- High resolution edge finding scans ( $5 \times 20 \mu \mathrm{~m}$ lines with 39 nm /pixel resolution per cantilever) - tip 11
- Scan of target 10 with tip 10 , moving one segment in either direction
- High resolution edge finding scans ( $5 \times 20 \mu \mathrm{~m}$ lines with $39 \mathrm{~nm} /$ pixel resolution per cantilever) - tip 12
- High resolution edge finding scans ( $5 \times 20 \mu \mathrm{~m}$ lines with 39 nm /pixel resolution per cantilever) - tip 14
- High resolution edge finding scans ( $5 \times 20 \mu \mathrm{~m}$ lines with 39 nm /pixel resolution per cantilever) - tip 15
- Tip 9 pre-scan of target 5

## STP068

## Planning:

- Wheel tests ( $5 \times$ rotations with 3 different pulse widths)
- Tile of $10 \times 10 \mu \mathrm{~m}$ pre-scans, $10 \%$ overlap, $512 \times 512$ of target 21 . Tip offset $-64 \mu \mathrm{~m}$
- $40 \times 40 \mu \mathrm{~m}$ pre-scans, $256 \times 256$ of target 21 -tip offsets -64 and $+64 \mu \mathrm{~m}$
- Expose facet 21

## STP069

## Planning:

Frequency scan of all cantilevers with updated parameters

## STP070

## Planning:

- Continuing exposure of target 21 from STP069

## STP071

## Planning:

- Continuing exposure of target 21 from STP069

## STP072

## Planning:

- Tile of $10 \times 10 \mu \mathrm{~m}$ pre-scans, $10 \%$ overlap, $512 \times 512$ of target 22 . Tip offset $+64 \mu \mathrm{~m}$
- $40 \times 40 \mu \mathrm{~m}$ pre-scans, $256 \times 256$ of target 22 - tip offsets 0 and $+64 \mu \mathrm{~m}$
- Target 2 incorrectly scanned

## STP073

## Planning:

- Continued exposure target 22

## STP074

## Planning:

- Continued exposure target 22

## STP075

## Planning:

- Post-exposure scan of target 21 with tip $14.80 \times 80 \mu \mathrm{~m}$ scan $\mathrm{w} / 64 \times 64$ pixel @ tip offset 0.0
- Post-exposure scan of target 21 with tip 14. $80 \times 80 \mu \mathrm{~m}$ scan $\mathrm{w} / 64 \times 64$ pixel @ tip offset -64.0
- Post-exposure scan of target 21 with tip $14.80 \times 80 \mu \mathrm{~m}$ scan $\mathrm{w} / 64 \times 64$ pixel @ tip offset +64.0
- Post-exposure scan of target 22 with tip $14.80 \times 80 \mu \mathrm{~m}$ scan $\mathrm{w} / 64 \times 64$ pixel @ tip offset 0.0
- Contact mode scan of target 6 (tip 8 ), 8 um w/ $288 \times 288$ pixel
- $2 \times 2$ tile of contact mode scans of target 6 (tip 8 ), 20 um w/ $256 \times 256$ pixel

## STP076

## Planning:

- $2 \times 2$ tile of contact mode scans of target 6 (tip 8 ), 20 um w/ $224 \times 224$ pixel
- Contact mode scan of target 6 (tip 8 ), 8 um w/ $288 \times 288$ pixel

## STP077

## Planning:

- Follow-up scan of target 21 with tip $14,80 \times 80$ um, $224 \times 224$ pixel, tip offset 0 microns
- Follow-up scan of target 21 with tip $14,80 \times 80$ um, $224 \times 224$ pixel, tip offset -64 microns
- Zoom of the centre of target 10 , tip $5.8 \times 8$ um, $256 \times 256$ pixel
- Follow-up scan of target 21 with tip $14,80 \times 80$ um, $224 \times 224$ pixel, tip offset +64 microns
- Post-exposure coarse scan of target 21 with tip $14.80 \times 80 \mu \mathrm{~m}$ scan $\mathrm{w} / 64 \times 64$ pixel @ tip offset -128 um
- Post-exposure coarse scan of target 21 with tip $14.80 \times 80 \mu \mathrm{~m}$ scan $\mathrm{w} / 64 \times 64$ pixel @ tip offset +128 um
- Post-exposure scan of target 22 with tip $14.80 \times 80 \mu \mathrm{~m}$ scan $\mathrm{w} / 224 \times 224$ pixel @ tip offset 0 um
- Post-exposure coarse scan of target 22 with tip $14.80 \times 80 \mu \mathrm{~m}$ scan $\mathrm{w} / 64 \times 64$ pixel @ tip offset 64 um

## STP078

## Planning:

- Follow-up of target 10 with cantilever 10 , tip offset $250 \mu \mathrm{~m}$ - tuning centre and zooming
- Follow-up of target 10 segment 159 with cantilever 10 , large particle
- Target 10, segment 159, small particle zoom, follow-up to SCAN_MD_M019_S067_2015-08-01T113051Z_TGT10
- Follow-up of target 10 segment 161 with cantilever 10 , tip offset 0
- Scan of target 10 segment 161 with tip 10 , tip offset $+64.0 \mu \mathrm{~m}$
- Scan of target 10 segment 161 with tip 10 , tip offset $+128.0 \mu \mathrm{~m}$
- Scan of target 10 segment 159 with tip 10, tip offset $-64.0 \mu \mathrm{~m}$
- Scan of target 10 segment 159 with tip 10 , tip offset $-128.0 \mu \mathrm{~m}$
- Scan of target 10 segment 158 with tip 10 , tip offset $0 \mu \mathrm{~m}$

## STP079

## Planning:

- Follow-up scan of target 21 with tip $14,80 \times 80$ um, $224 \times 224$ pixel, tip offset -128 microns
- Follow-up scan of target 21 with tip $14,80 \times 80$ um, $224 \times 224$ pixel, tip offset 128 microns
- XY calibration of cantilever 14, hybrid mode, main scan Y
- Follow-up scan of target 22 with tip $14,80 \times 80$ um, $224 \times 224$ pixel, tip offset 0 microns
- Follow-up scan of target 22 with tip $14,80 \times 80$ um, $224 \times 224$ pixel, tip offset 64 microns
- Tip calibration of cantilever 8, hybrid contact mode, main scan Y
- Tip calibration of cantilever 14 , hybrid mode, main scan $Y$
- Zoom of the centre of target 10, tip 5. $8 \times 8$ um, $256 \times 256$ pixel

## STP080

## Planning:

- Frequency survey of all cantilevers using default parameters
- 10 high excitation resonance sweeps to shake off material from tip 10
- Tip calibration of cantilever 10 after vibrating to clean
- Tile of $10 \times 10 \mu \mathrm{~m}$ post-scans, $10 \%$ overlap, $384 \times 384$ of target 22 . Tip offset $+64 \mu \mathrm{~m}$
- Tile of $10 \times 10 \mu \mathrm{~m}$ post-scans, $10 \%$ overlap, $512 \times 512$ of target 21 . Tip offset $-64 \mu \mathrm{~m}$

## Additional Notes:

2015-10-28 04:40:00 : Frequency survey of all cantilevers using default parameters

2015-10-28 05:25:52 : 10 high excitation resonance sweeps to shake off material from tip

## 2015-10-28 05:57:32 : Tip calibration of cantilever 10 after vibrating to clean

Frequency scans:

## STP081

## Planning:

- Shake tip 14 to try and clean off any contaminants
- Tip calibration of cantilever 14 after shaking, hybrid mode, main scan $Y$
- Tip calibration of cantilever 10 after vibrating to clean in STPO8O - standard excitation
- Follow-up scan of target 21 with tip $15,80 \times 80$ um, $224 \times 224$ pixel, tip offset -100 microns
- Set automatic retraction calculation with safety factor of 3
- Run feature vector with trend and median correction, $50 \%$ threshold and $200 \%$ zoom on feature with $>5$ points
- Follow-up to frequency vector using tip $15,224 \times 224$ pixels. Auto retraction height ON
- Pre/post scan of facet 13 with cantilever 14
- Follow-up scan of target 22 with tip $14,80 \times 80$ um, $224 \times 224$ pixel, tip offset 0 microns
- Follow-up scan of target 22 with tip $14,80 \times 80$ um, $224 \times 224$ pixel, tip offset 64 microns
- Likely wrong target is scanned, wheel should have moved from segment 208 to 352. Reference point was found but then the wheel got stuck at segment 0 .

## Additional Notes:

2015-11-04 05:58:00 : Shake tip 14 to try and clean off any contaminants

## STP082

## Planning:

- Frequency survey of all cantilevers using default parameters
- Follow-up scan of SCAN_MD_MO22_SO79_2015-10-22T115152Z_TGT21 with tip $15,80 \times 80$ um, $128 \times 128$ pixel
- Feature vector (trend+median, count pixel >3, thresh $40 \%$, $3 \times$ zoom, set $256 \times 256$ pixel)
- Set automatic retraction calculation with safety factor of 2
- Follow-up to frequency vector using tip $15,256 \times 256$ pixels. Auto retraction height ON
- Tip calibration of cantilever 15, hybrid mode, main scan $Y$
- Coarse repeat scan of target 10, now with cantilever 9, before feature vector
- Feature vector (trend, $50 \%$ thresh, min pixel $50,2 \times$ zoom, $256 \times 256$ follow-up)
- $256 \times 256$ follow-up to feature vector of target 10 with cantilever 9
- XY calibration with tip $14,80 \times 80$ um, $256 \times 256$ pixel
- XY calibration with tip $14,40 \times 40$ um, 192x192 pixel
- XY calibration with tip $14,10 \times 10$ um, $128 \times 128$ pixel

## Additional Notes:

2015-11-11 04:56:00 : Frequency survey of all cantilevers using default parameters

## STP083

## Planning:

- Frequency survey of all cantilevers using default parameters
- Edge finding line scans with cantilever 1, optimised parameters
- Edge finding line scans with cantilever 2, optimised parameters
- Edge finding line scans with cantilever 3, optimised parameters
- Edge finding line scans with cantilever 16 , optimised parameters
- Repeat of scan previously showing two particles, target 14 tip 9. Now see one new?
- Target 10 , segment 159 , small particle zooms

## Additional Notes:

2015-11-18 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP084

## Planning:

- Frequency survey of all cantilevers using default parameters
- XY calibration with tip $14,80 \times 80$ um, $256 \times 256$ pixel
- Tip calibration of cantilever 16 , hybrid mode, main scan $Y$
- Tip calibration of cantilever 15 , hybrid mode, main scan $Y$
- Tip calibration of cantilever 9
- Follow-up to SCAN_MD_M022_S082_2015-11-14T074809Z_TGT10, 3x scans
- Zoom of target 10 with cantilever 9
- Pre-scan of target 24 with tip 14
- Edge finding scan with tip 16, estimated linear position

## Additional Notes:

2015-11-25 05:10:00 : Frequency survey of all cantilevers using default parameter

## STP085

## Planning:

- Frequency survey of all cantilevers using default parameters
- Cantilever 1 edge finding scan
- Cantilever 2 edge finding scan
- Cantilever 3 edge finding scan
- Tip calibration of cantilever 1, hybrid mode, main scan Y
- Pre-scan of target 24 with tip 14, tip offset +64 microns
- Pre-scan of target 24 with tip 14, tip offset -64 microns
- Expose facet 13 during close-Sun pointing
- Pre-scan of target 24 with tip 14 , tip offset +128 microns
- Tip calibration of cantilever 15 , hybrid mode, main scan $Y$

## Additional Notes:

2015-12-02 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP086

## Planning:

- Frequency survey of all cantilevers using default parameters
- Edge finding scan with tip 5, estimated linear position
- Edge finding scan with tip 8, and 12, estimated linear position, w/ control data
- Pre-scan of target 24 with tip 14 , tip offset 0 microns, $40 \times 40$
- Coarse repeat scan of target 10, now with cantilever 9, with control data
- Follow-up to SCAN_MD_M022_S082_2015-11-14T074809Z_TGT10, 3x scans repeat of STP084, higher retract sCiences

## Additional Notes:

2015-12-09 05:10:00 : Frequency survey of all cantilevers using default parameters

2015-12-09 06:05:00: Tip calibration of cantilever 12

Tip 12 resonance has vanished.

## STP087

## Planning:

- Frequency survey of all cantilevers using default parameters
- Tip calibration of cantilever 11 , hybrid mode, main scan Y
- Tip calibration of cantilevers 2, 3, 4, hybrid mode, main scan $Y$
- Cantilever 6 edge finding scan
- High resolution tip calibration of cantilever 15, hybrid mode, main scan Y
- Coarse pre-scan of target 24 with tip 5
- Follow-up of target 10 segment 161 with cantilever 5, tip offset +64

## Additional Notes:

2015-12-16 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP088

## Planning:

- Frequency survey of all cantilevers using default parameters
- Coarse pre-scan of target 24 with tip 5 , tip offset +64 um
- Coarse pre-scan of target 24 with tip 5, tip offset -64 um
- Coarse pre-scan of target 24 with tip 5 , tip offset +128 um
- Phase survey of all cantilevers using default parameters
- Coarse pre-scan of target 24 with tip 5 , tip offset -128 um
- Medium pre-scan of target 24 with tip 5, tip offset 0 um
- Medium pre-scan of target 24 with tip 5 , tip offset 64 um
- Medium pre-scan of target 24 with tip 5, tip offset -64 um

## Additional Notes:

2015-12-23 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP089

## Planning:

- Frequency survey of all cantilevers using default parameters
- Contact mode scan of target 10 (segment 161 ) at $-64 \mu \mathrm{~m}$ with control data
- Contact mode scan of target 10 (segment 161) at -128 $\mu \mathrm{m}$ with control data
- Contact mode scan of target 10 (segment 161) at $+128 \mu \mathrm{~m}$ with control data
- Contact mode scan of target 10 (segment 159) at $-64 \mu \mathrm{~m}$ with control data
- Contact mode scan of target 10 (segment 159) at $-128 \mu \mathrm{~m}$ with control data
- Contact mode scan of target 10 (segment 159) at $+128 \mu \mathrm{~m}$ with control data

## Additional Notes:

2015-12-30 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP090

## Planning:

- Frequency survey of all cantilevers using default parameters
- Coarse pre-scan of target 24 with tip 1 , tip offset +64 um
- Coarse pre-scan of target 24 with tip 1 , tip offset +128 um
- Coarse pre-scan of target 24 with tip 1 , tip offset -128 um
- Medium pre-scan of target 24 with tip 1, tip offset 0 um
- Medium pre-scan of target 24 with tip 1, tip offset -64 um

## Additional Notes:

2016-01-06 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP091

## Planning:

## Additional Notes:

2016-01-13 05:10:00 : Frequency survey of all cantilevers using default parameters

Cantilever 1 still appears to be "gone" - but other cantilevers on the block are fine, so it's not the excitation piezo or anything more global. It could be an electrical problem with the connection, or something that has dramatically changes the resonance frequency.

## STP092

## Planning:

## Additional Notes:

2016-01-20 05:10:00 : Frequency survey of all cantilevers using default parameters

Cantilever 1 resonance still gone, but there's something there:

## 2016-01-23 05:55:00 : Resonance tests of tip 1

Expanded frequency range:

Standard resonance at 83670.2 Hz . Turning up the excitation level to full:

2016-01-23 06:14:28 : Z piezo / strain gauge tests

2016-01-24 06:24:28 : Set point tests (10.0-20.0\% in steps of 0.1\%)
Set HK rate to 2 seconds again, then set the setpoint to $10-20 \%$ in steps of $0.1 \%$.

## STP093

## Planning:

## Additional Notes:

2016-01-27 05:10:00 : Frequency survey of all cantilevers using default parameters

STP093-5. RO-C-MIDAS-3-EXT1-SAMPLES-V3.0/IMG_1601223_1604100_041_ZS
The top left part is very clean, (most likely) due to contact mode scan RO-C-MIDAS-3-EXT1-SAMPLES-V3.0/IMG_1601223_1604100_032_ZS. Conclusion - contact mode may clean target of particles.

## STP094

## Planning:

- Target 13 coarse pre-scanned with tip $11-100$ to $+100 \mu \mathrm{~m}$ plus one $15 \times 15 \mu \mathrm{~m}$ scan at centre
- Course scan completed at STP94-3, repeated in STP97-2 following new exposures of target 13
- Target 24 has some good scans with tip 5 (but not all are good)
o try and "fill in the gaps" with another tip
- Completed in STP094-5,6 with tip 2
- Tip 1 testing - broad frequency scan with all excitation levels
- Completed in this STP
- XY calibration scans
- Completed in STP094-1,2
- Scan of centre of target 13, follow-up to exposure in STP092
- Completed as above in STP094-3
- Further tip 1 resonance tests
- Completed in this STP

## Additional Notes:

2016-02-03 05:10:00 : Frequency survey of all cantilevers using default parameters:

## STP095

## Planning:

Planning priorities for the coming months:
highest resolution images of existing dust
mapping of spatial distribution of dust on exposed targets
magnetic mode
collect more dust

- OBSW upgrade
- upgrade scheduled for 10th Feb (just after the start of STP095)
- Completed successfully this STP
- Tip image of tip 11 at higher resolution (to see cometary dust on the tip)
- Completed: Scan 1.
- Line scans with control data on and various $Z$ steps and set points to see what the limits are the set point (and therefore the force that we can apply)
- Contact mode (line) scan with ctrI_data on a solgel and silicon facet with the same cantilever (e.g. 14) with different $z$ steps ( 4,8 on Si and $4,8,12,16,24$, maybe more on solgel) and different setpoints (tbd).
- Completed
- Repeat STP093-6 right hand side divided into two scans, as high resolution as time allows check $z$ centre position to get good scans
- Scan with larger approach range to get particle in bottom left, approach further down in $Y$ and to -ve linear stage to try and catch the larger particle
- Completed
- Repeat of target 10 scans in STP093
- Completed
- Prescans on a Si facet - facet 6 is a little 'prepared' and it was used for one small exposure
- Completed

## Additional Notes:

2016-02-10 05:10:00 : Frequency survey of all cantilevers using default parameters:

The resonance of cantilever 1 has returned to ~nominal

## OBSW upgrade:

2016-02-10 07:00:00 : Start of OBSW upgrade slot (5 hours) 2016-02-10 12:00:00 : End of OBSW upgrade slot (5 hours)

STP095-1. RO-C-MIDAS-3-EXT1-SAMPLES-V3.0/IMG_1604023_1606900_003_ZS
No (good) data - presumably due to drift after reboot in OBSW upgrade. Frequency scans look good, but show a large frequency shift:

Looking at the cantilever AC and temperature confirms:

2016-02-11 23:31:00 : Line scans in CON mode with tip 14, facet 6, various setpoints and Z steps

Control data for all cases look OK, although it's getting marginal for 0.01 V . )

Similar results as above.

## STP096

## Planning:

- Tip image of tip 1 (now that resonance looks nominal again)
- Completed STP096-1
- Additional target 6 scans
- Completed STP096-4\&5
- Frequency vector to zoom on one or more of STP093-10 particles
- Completed

## Additional Notes:

2016-02-17 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP096-3. RO-C-MIDAS-3-EXT1-SAMPLES-V3.0/IMG_1604023_1606900_030_ZS:

Follow-up to frequency vector using tip $11,256 \times 256$ pixels. Auto retraction height ON Since the feature vector failed to find a feature, the image scan is more-or-less a repeat of the previous scan.

Retraction height here was 1881.9 nm - in the original scan it was 2580 nm . This shows that the onboard calculation of the retraction height worked fine - the safety factor was 2.75 in the commanded scan, and 2.0 in the follow-up.

## STP097

## Planning:

Exposures planned for OCM in the middle and end of STP were aborted to avoid reexposing target 13 that caught "fresh" dust by disabling MIDAS SID for shutter close/open periods.

- Repeat odd scan STP095-2 starting from lower left
- smaller range as well to avoid artefact
- Completed in STP097-3
- Repeat of target 10 (STP95-4)
- increase retraction height to better image particles
- Completed in STP097-5
- High resolution tip 9 tip image
- after the target 10 re-scan
- Completed in STP97-6

## Additional Notes:

2016-02-24 05:10:00: Frequency survey of all cantilevers using default parameters

## STP098

## Planning:

Exposures now planned with target 11 rather than 13 (as many particles collected on target 13 awaiting high resolution scanning).

- Repeat of frequency vector scan from STP096
- Completed
- Further prescan of facet 6 all with tip 7
- Completed
- Contact mode scan with control data with tip 9
- Completed

## Additional Notes:

2016-03-02 05:10:00: Frequency survey of all cantilevers using default parameters

STP098-1. RO-C-MIDAS-3-EXT1-SAMPLES-V3.0/IMG_1604023_1606900_068_ZS
Original image: STP93-10
Pre-frequency vector: STP96-2
Bad frequency vector (repeat): STP96-3

Saturation is reached, as per the previous case. Note that this is almost certainly because hitting a particle on approach. If repeated this again, should approach at the bottom left ( $\mathrm{X}=\mathrm{H} \_\mathrm{L}$ ) to start on the substrate and avoid this.

2016-03-05 05:55:00 : Resonance curve checks for magnetic cantilevers prior to amplitude calibration

## Tip 1

So good values to use for amplitude calibration line scans:
Tip 2

All values look OK , although exc 2 and 3 could be dialled down by one notch in AC gain to ensure don't saturate.

## Tip 3

All values are fine, but can probably increase the first to gain=4.

Tip 4

These values seem considerably reduced compared with the (long ago) frequency survey.

## STP099

## Planning:

- Scans of target 13
- targeted and/or frequency vector scans following STP097 results
- look at frequency vector - can we run on a previous scan and use for multiple follow-ups with minimal template changes
- further coarse scans to identify more particles
- Completed
- More preparation for magnetic mode scans
- frequency sweeps with phase for magnetic cantilevers
- line scans for height calibration
- Completed
- Repeat STP097-5
- approaching at "bottom right" and avoiding the large feature on the left
- Completed

## Additional Notes:

2016-03-09 05:10:00: Frequency survey of all cantilevers using default parameters

2016-03-11 19:28:52 : Amplitude calibrate line scans (with control data) of magnetic cantilevers - tip 1
$5 \times 32$ sets of control data received for tip 1 and 5 lines.

None of the tip 1 cases give good amplitude curves. Checking the frequency scans, some saturated (they were close before), and hence we have the oscillating 10V/0V behaviour and lots of hunting of the Z piezo.

Conclusion: we are rather hammering with these settings - WP $=100 \%$, $\mathrm{SP}=7 \%$, this probably gives good images (see STP098), but doesn't help the tip.

2016-03-11 21:24:52 : Amplitude calibrate line scans (with control data) of magnetic cantilevers - tip 2
Line scans at all excitation levels:

AUSTRIAN ACADEMY OF ACADEMY OF
SCIENCES

2016-03-12 05:40:00 : Frequency scans of magnetic cantilevers with phase output

See odd mirroring of the curve, and as before it doesn't always mirror exactly at zero.
2016-03-12 05:55:28 : Amplitude calibrate line scans (w/ctrl data) of magnetic cantilevers - tip 3

## STP100

## Planning:

- Scans of target 13
- targeted and/or frequency vector scans following STP097 results
- Completed.
- More preparation for magnetic mode scans
- line scans for height calibration with tip 4 (1-3 scheduled in STP099)
- Completed this STP.
- Post scan of target 11 (low priority)
- Completed in STP103-1, STP114-9, STP117-1

## Additional Notes:

2016-03-16 05:10:00 : Frequency survey of all cantilevers using default parameters

2016-03-16 05:58:52 : Amplitude calibrate line scans (w/ctrl data) of magnetic cantilevers - tip 4

ROSETTA-MIDAS-Analysts Notebook
Document Version : 1.0 Date : 28 November 2018

Page : 119

2016-03-16 08:41:52 : Frequency scans of magnetic cantilevers with phase (repeat of STP099 to look for shifts)

Seems very repeatable (compared to STP099).

## STP101

## Planning:

- Further magnetic line scans
- Test frequency scan

## Additional Notes:

2016-03-23 05:10:00 : Frequency survey of all cantilevers using default parameters

STP101-1. RO-C-MIDAS-3-EXT1-SAMPLES-V3.0/IMG_1606823_1609700_035_ZS
No data - frequency adjust parameters were mis-matched in all scans in this STP. Topography data can be recovered from line scans.

2016-03-25 10:16:52 : Amplitude calibrate line scans (w/ctrl data) of magnetic cantilevers - tip 1

## STP102

## Planning:

- Next set of percentage tests
- Completed
- Continued exposure of target 6
- Completed
- Post scan of target 6 (exposed in STP101/102, far excursion)
- centre, tip 7
- Completed
- Tip image of tip 1
- Completed
- Diagnostic line scans of target 13 to investigate odd slope/saturation effects
- i.e. with control data enabled
- Completed
- Follow-up scan of target 13
- Completed

## Additional Notes:

2016-03-30 17:10:00 : Frequency survey of all cantilevers using default parameters

## STP103

## Planning:

- Post scan of target 11
- Completed
- Follow-up of STP079-1 with tip 1
- Completed
- Further target 10 scans
- Completed
- Further target 13 scans
- Completed

## Additional Notes:

2016-04-06 05:10:00 : Frequency survey of all cantilevers using default parameters

## Future Planning

- Target 10 - map further away from the centre (laterally and by segment)
try to find extent of coverage, and see if we can determine if we see a single impact etc.
Further scans of target 10 made in various future STPs.
- Target 11 - low level scans to check OCM exposures

Scans of target 11 made in various future STPs.

- Target 12 - follow-up to particles seen
see if we can see fragments or anything else (only one sided scans so far)
Scans made in future STPs.
- Target 13 - more scans of particles

Completed in future STPs.

- Target 14 - follow-up STP083-6 possible particle

Scan same area in STP108-11, particle not seen, seems may not be scanning the same area/unknown error

- target - 21 - follow-up to areas not yet medium resolution scanned also follow-up to small scans (10x10)
Not completed-other targets took priority
- Increase Z step size to speed up future scans

To speed up image acquisition in the "final phase" of Rosetta, without any complicated OBSW changes, the most straightforward thing to do is increase the $Z$ step size. This is the step by which the $Z$ piezo is advanced before checking the AC/DC value to see if it is below the threshold, or in the window. Typically we use a value of 4 (meaning $4 x$ the $Z$ calibration factor of $0.164=0.656 \mathrm{~nm}$ ).
Looking at values in the range 4-10, and for various typical sizes:

In principle should not be a problem from the force perspective using a large $Z$ step, since it's just equivalent to having a slightly larger separation between the working and set points (i.e. we tap on the sample a little longer).
We do have to be careful that we adjust the frequency sweep settings accordingly so that we stay inside the window.
Larger Z step was implemented in future scans.

## STP104

## Planning:

- Tip image of tip 1 (failed in STP102)
- Completed
- Coarse post-excursion scan of target 6 with tip 7
- (failed in STP102)
- Completed
- Follow-up scan of target 13
- repeat of aborted scan from STP102, larger retract, magnetic mode on
- attempt to image cluster at centre of target 13 (moderate scan, frequency vector and 1st, 2nd rank zooms)
- Completed

## Additional Notes:

2016-04-13 05:10:00 : Frequency survey of all cantilevers using default parameters

$$
\begin{aligned}
& \\
& \hline
\end{aligned}
$$

## STP105

## Planning:

## Additional Notes:

2016-04-20 05:10:00 : Frequency survey of all cantilevers using default parameters

2016-04-20 09:15:00 : OBSW upgrade
2016-04-20 15:15:00 : OBSW upgrade end

## STP105-1. RO-C-MIDAS-3-EXT2-SAMPLES-V3.0/IMG_1609623_1612500_060_ZS :

Follow-up to STP103-4, lower left cluster.
Most of the image maximum extension reached: possibly due to still insufficient warm-up after upgrade. The tip 1 frequency scans (1st before the update, 2 nd after, $3+4$ at start of the scan):

## STP106

## Planning:

- Increased $Z$ step size
- Repeat tiled $10 \times 10$ scans on target 6
- Completed STP109-7,8,9,10
- Repeat zoom that failed (in STP100-6, STP102-3, STP104-3) with tip 2
- Completed
- Further magnetic prep line scans
- Tip 1 image (failed in previous STPs)
- Tip 15 image ( $512 \times 512$ with $4 \times 4 \mu \mathrm{~m}$ )
- Re-schedule of target 13 cluster with tip 2 (failed in STP104)
- Target 13 follow-up at - $192 \mu \mathrm{~m}$ (central stripe) with tip 2

## Additional Notes:

2016-04-27 05:10:00 : Frequency survey of all cantilevers using default parameters
cantilever 15 resonance vanished
No problems according to event history, but no data - due to ground station problems.
Recovered key values from House Keeping.

## Failed operations

2016-04-27 05:57:52 : Tip image of tip 1, wheel re-try enabled (2 attempts). FAIL.
No data - due to ground station problems.

2016-04-27 15:18:52 : High resolution tip calibration of cantilever 15, hybrid mode, main scan $Y$ : Failed scan.
Tip 15 resonance vanishes.

2016-04-28 16:26:52 : Tip 2 control data tests for magnetic mode + various $Z$ steps: FAILED Linear move timeout, approach failed.
Increase timeouts
Add pre-move to line scans.

STP106-1. RO-C-MIDAS-3-EXT2-SAMPLES-V3.0/IMG_1609623_1612500_095_ZS :
Repeat follow-up of STP100-6 with tip 2 (extended piezo range).
Magnetic mode enabled.
Piezo centred at zero (to allow more retraction / height).
Attempted to scan this in STP102-3 but lost resonance. And again in STP104-3 with increased retraction. Got a full scan, but with lots of distortion. Decided to scan with tip 2 and shifted centre in this STP.
Scan eventually aborts.

## STP107

## Planning:

- Frequency survey of all cantilevers using default parameters
- Repeat scan of STP100-1 with tip 8
- Repeat scan of STP103-3 with tip 1
- Zoom scan of target 13 with tip 2
- Tip image of tip 1
- Coarse scan of facet 13 with tip 1 , tip offset 0 , segment 210
- Coarse scan of facet 13 with tip 1 , tip offset 0 , segment 206
- Coarse scan of facet 13 with tip 1 , tip offset -192 , segment 207
- Coarse scan of facet 13 with tip 1, tip offset 192, segment 207
- Coarse scan of facet 13 with tip 1, tip offset -192, segment 209
- Coarse scan of facet 13 with tip 1, tip offset 192, segment 209
- Coarse scan of facet 13 with tip 1, tip offset 256, segment 209-zstep 8

## Additional Notes:

2016-05-04 05:10:00 : Frequency survey of all cantilevers using default parameters

Tip 2 looks bad.

## STP108

## Planning:

- Frequency survey of all cantilevers using default parameters
- Frequency tests of cantilever 2
- Repeated frequency scans with problematic cantilever $(1,12,15)$
- Line scans on target 10 to check sample slope far from the centre
- High resolution tip calibration of cantilever 15, hybrid mode, main scan Y
- Scans with tip 1 in either direction from fluffy particle
- Attempt to get a tip image of tip 2 (after shaking earlier)
- Coarse scan of facet 13 with tip 1, tip offset 0, segment 205
- Coarse scan of facet 13 with tip 1 , tip offset 0 , segment 204
- Coarse scan of facet 13 with tip 1 , tip offset 0 , segment 210
- Coarse scan of facet 13 with tip 1 , tip offset 0 , segment 211
- Coarse scan of target 10 scan with tip 9, centre of segment 157
- Coarse scan of target 10 scan with tip 9, centre of segment 163
- Repeat of STPO83-6 with tip 1

## Additional Notes:

2016-05-11 05:10:00 : Frequency survey of all cantilevers using default parameters

## 2016-05-11 05:58:52 : Frequency tests of cantilever 2

Normal behaviour already seen after first shaking. First and last of the "normal" scans:

2016-05-11 06:27:32 : Repeated frequency scans with problematic cantilever (1, 12, 15)

2016-05-11 07:53:32 : Line scans on target 10 to check sample slope far from the centre (165 and 155)

## STP109

## Planning:

- Frequency survey of all cantilevers using default parameters
- Another attempt to get a tip image of tip 1!
- Tip 8 calibration, dynamic mode, before contact mode scan
- Tip 8 dynamic mode scan of target 13
- Contact mode scan of target 13 with tip 8 , tip offset -64 um
- Repeat scan of STP107-1 after contact mode scan
- Tip 8 calibration, dynamic mode, after contact mode scan
- $4 x$ high resolution post-scans of target 6 with cantilever 1 ( $8 \times 8$ micron)
- Coarse scan of facet 13 with tip 1 , tip offset 256 , segment 206 , tip offset -64 um
- Coarse scan of facet 13 with tip 1, tip offset 256, segment 206, tip offset -128 um
- Enabling adaptive retraction with safety=2, min retract $2.5 u m$. Monitoring adaptive paramameters
- Coarse scan of facet 13 with tip 1 , tip offset -64, segment 210
- Repeat scan of STP103-3 with tip 1 - higher resolution, magnetic mode

## Additional Notes:

2016-05-18 15:10:00 : Frequency survey of all cantilevers using default parameters

## STP110

## Planning:

- Frequency survey of all cantilevers using default parameters
- High resolution tip calibration of cantilever 15, hybrid mode, main scan $Y$
- Line scans on target 10 to check sample slope far from the centre (tuning centre)
- Follow-up STP108-6 facet 13/tip 1, tip offset +40 , segment 204
- Coarse scans of facet 13 with tip 1

## Additional Notes:

2016-05-25 05:10:00 : Frequency survey of all cantilevers using default parameters

2016-05-26 07:08:52 : Line scans on target 10 to check sample slope far from the centre (tuning centre)

Problem with tip 1.
Repeat in later STP.

## STP111

## Planning:

- Frequency survey of all cantilevers using default parameters
- Coarse scans of facet 13 with tip 1
- Tip calibration of cantilever 4

## Additional Notes:

2016-06-01 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP112

## Planning:

- Frequency survey of all cantilevers using default parameters
- Coarse scan of facet 13 with tip 4
- Repeat of STP107-5 with centre to higher Z HV and tip 4
- Coarse scans of facet 13 with tip 1
- Repeat of STP108-7 with tip 4 prior to frequency vector
- Coarse scans of facet 13 with tip 4
- Tip calibration of cantilever 4
- XY calibration scan using tip 4
- Coarse scan of facet 13 with tip 4
- 2016-06-14 06:00:00 : OBSW upgrade start
- 2016-06-14 16:00:00 : OBSW upgrade end
- 2016-06-14 16:12:00 : Dummy scan (not at surface) to warm up after OBSW upgrade

## Additional Notes:

2016-06-08 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP113

## Planning:

- Frequency survey of all cantilevers using default parameters
- Coarse scans of facet 13 with tip 1
- High resolution tip calibration of cantilever 4
- Coarse scans of facet 13 with tip 4
- Coarse scan of target 10 scan with tip 9
- Coarse scan of facet 13 with tip 4
- Tip 8 dynamic mode scan of target 13
- Contact mode scan of target 13 with tip 8
- Tip 8 dynamic mode scan of target 13 after contact scan
- Zoom STP111-4

## Additional Notes:

2016-06-15 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP114

## Planning:

- Frequency survey of all cantilevers using default parameters
- Coarse scans of facet 13 with tip 4
- High resolution tip calibration of cantilever 8
- Coarse scan of target 10 scan with tip 9
- Auto-zoom of target 13 following feature vector tip 4
- Repeat of STP112-6 with $Z$ piezo centre shift
- Coarse scan of target 11
- Repeat of STP112-2 with centre to higher Z HV and tip 4
- Repeat of STP112-5 with tip 4 to see any overlap

## Additional Notes:

2016-06-22 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP115

## Planning:

- Frequency survey of all cantilevers using default parameters
- Tip image of tip 2
- High resolution tip calibration of cantilever 4
- Coarse scan of facet 13 with tip 2
- $40 x 40 u m$ scan of facet 13 with tip 2
- $10 \times 10 u m$ scan of facet 13 with tip 2
- $1 x 1 u m$ scan of facet 13 with tip 2
- Tip 8 dynamic mode scan of target 13
- Contact mode scan of target 13 with tip 8
- Tip 8 dynamic mode scan of target 13 - after contact scan
- Tip calibration of cantilever 8
- Repeat of STP113-2 with tip 2
- Retry of coarse scan of facet 13 with tip 4
- Retry (after STP106) 80x40 micron scan of the bottom half of STP100-5, tip 2

## Additional Notes:

2016-06-29 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP116

## Planning:

- Frequency survey of all cantilevers using default parameters
- Coarse scans targets 13 and 10
- Tip image tip 8

## Additional Notes:

2016-07-06 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP117

## Planning:

- Frequency survey of all cantilevers using default parameters
- Repeat height calibration scans with different piezo extensions in different order
- Coarse re-scan of STP100-6 with tip 3
- Coarse scan of target 10 scan with tip 9
- Coarse scan of target 10 scan with tip 9
- Scan of larger particles at centre of STP114-2 tip 3
- Coarse scan of target 11 (exposed during OCMs) - checking for July outburst
- Tip calibration of cantilever 3, hybrid mode, main scan Y

## Additional Notes:

2016-07-13 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP118

## Planning:

- Frequency survey of all cantilevers using default parameters
- Tip 8 dynamic mode scan of target 13
- Contact mode scan of target 13 with tip 8
- Tip 8 dynamic mode scan of target 13 - after contact scan
- Repeat of STP114-10 zooming on top right particle
- Repeat of STP114-10 zooming on lower left particle
- Repeat S107-5 with tip 3
- Further scans of target 12
- Coarse scan of facet 13 with tip 4
- Follow-up from S113-16 with tip 4. Zoom top left
- Shake tips 5 and 7
- Line scans in CON mode with tip 5, facet 6 various setpoints and $Z$ steps
- Line scans in CON mode with tip 5, facet 24 various setpoints and $Z$ steps
- Line scans in CON mode with tip 7, facet 6 various setpoints and $Z$ steps
- Line scans in CON mode with tip 7, facet 24 various setpoints and $Z$ steps

## Additional Notes:

2016-07-20 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP119

## Planning:

- Frequency survey of all cantilevers using default parameters
- Shake tip 3
- Re-scan of STP117-8 with tip 3
- Zoom scan of STP117-8 with tip 3
- Coarse re-scan of STP114-1 with tip 4
- Cantilever 1 edge finding scan
- Cantilever 2 edge finding scan
- Cantilever 3 edge finding scan
- Cantilever 4 edge finding scan
- High resolution tip calibration of cantilever 8

## Additional Notes:

2016-07-27 05:10:00 : Frequency survey of all cantilevers using default parameters

Frequency ( Hz )

## STP120

## Planning:

- Frequency survey of all cantilevers using default parameters
- Tip calibration of cantilever 8, hybrid mode, main scan Y
- High resolution tip calibration of cantilever 4
- Tip calibration of cantilever 3
- Coarse scan of facet 13 with tip 2
- Repeat STP118-6 with centre shifted and higher res
- Coarse scan of target 13
- Tip 5 dynamic mode scan of target 13
- Contact mode scan of target 13 with tip 5
- Tip 5 dynamic mode scan of target 13
- Repeat of STP117-11 zoom on top left particle

## Additional Notes:

2016-08-03 05:10:00 : Frequency survey of all cantilevers using default parameters

## STP121

## Planning:

- Tip calibration of cantilever 4
- Repeat of STP118-8
- Auto-zoom of target 13 following feature vector, tip 4
- Attempt to re-scan particle STP107-5 with tip 5
- Attempt to zoom (10x10um) particle S107-5 with tip 5
- Shake tip 9
- Coarse repeat of STP084-6 prior to contact/control data scan
- Contact mode repeat of STP084-6, tip 9, control data ON
- repeat of STP084-6 after contact/control data scan
- Coarse repeat scan of target 10 with cantilever 9 (repeat of S082-4)
- Contact mode repeat of STP082-4, tip 9, control data ON
- Coarse repeat scan of target 10 with cantilever 9 after contact mode
- High resolution tip calibration of cantilever 9

## STP122

## Planning:

- Frequency survey of all cantilevers using default parameters
- Shaking tip 4
- Coarse scans of facet 13 with tip 4
- Tiled high resolution scans of facet 13 with tip 4

## Additional Notes:

2016-08-15 10:15:00 : Frequency survey of all cantilevers using default parameters

## STP123

## Planning:

- Frequency survey of all cantilevers using default parameters
- Repeat scans of target 13
- Repeat scan of STP098-1 prior to contact mode scan
- Contact mode repeat of STP098-1, tip 9, control data ON
- Repeat scan of STP098-1 after contact mode scan

## Additional Notes:

2016-08-21 10:16:00 : Frequency survey of all cantilevers using default parameters

## STP124

## Planning:

- Frequency survey of all cantilevers using default parameters
- Tip calibration of cantilever 4
- Tip calibration of cantilever 9
- Coarse repeat scan of target 10 with cantilever 9 (repeat of STP082-4)
- Contact mode repeat of S082-4, tip 9, control data ON
- Repeat of STP123-5 at higher resolution
- Auto-zoom of target 13 following feature vector, tip 4

## Additional Notes:

2016-08-30 10:15:00 : Frequency survey of all cantilevers using default parameters

## STP125

## Planning:

- Frequency survey of all cantilevers using default parameters
- Repeat of STP123-1 (facet 13, tip 4)
- Zoom of STP123-9
- Repeat of STP122-1 (facet 13, tip 4)
- Repeat of S122-1 (facet 13, tip 4)

## Additional Notes:

2016-09-02 10:16:40 : Frequency survey of all cantilevers using default parameters

AUSTRIAN
ACADEMY OF
ACADEMY OF
SCIENCES

## STP126

## Planning:

- Frequency survey of all cantilevers using default parameters
- Coarse scan of facet 13 with tip 2
- Repeat STP100-3 (coarse overview, tip 4)
- Repeat left hand side of STP123-8 (tweak centre)
- Left hand side of STP123-10
- Auto-zoom of target 13 following feature vector, tip 4
- Zoom of cluster in STP123-20
- Coarse scans of facet 13

## STP127

## Planning:

- Shake cantilever 4
- Frequency survey of all cantilevers using default parameters
- Tip calibration of cantilever 4
- Repeat S120-10
- Repeat S120-10 contact mode
- Repeat S120 after contact mode
- Repeat scans on targets 13 and 10, also in contact mode
- Additional height calibration scans at different piezo extensions
- XY calibration scan
- Tip image tip 4

## Additional Notes:

2016-09-11 10:14:40 : Frequency survey of all cantilevers using default parameters

## STP128

## Planning:

- Frequency survey of all cantilevers using default parameters
- Dummy scan (not at surface) to warm up after standby
- Repeat of STP127-7 with tweaked centre
- Contact mode scan with control data
- S127-8 (higher resolution) before contact scan
- Contact mode scan with control data, repeat S127-8
- Repeat S127-8 (low resolution) after contact scan
- Dummy scan (not at surface) to warm up after standby
- Repeat of S123-13
- Contact mode scan with control data

## Additional Notes:

2016-09-20 10:16:00 : Frequency survey of all cantilevers using default parameters

Frequency ( Hz )

## STP129

## Planning:

- Coarse scan of facet 13 with tip 4 , segment 211 , tip offset 240 um
- Coarse scan of facet 13 with tip 4 , segment 211, tip offset -240 um
- Coarse scan of facet 13 with tip 4 , segment 212 , tip offset -240 um
- Coarse scan of facet 13 with tip 4 , segment 212 , tip offset 240 um
- High resolution image of tip calibration sample, tip 8, hybrid mode, main scan $Y$

## Appendix A - Rosetta planning periods

The following table lists the start of each STP (short term planning) cycle and its corresponding medium term planning (MTP) cycle. These planning periods form the basis for commanding and data analysis from Rosetta and are referenced extensively in the report.

|  | MTP |  | STP |  | START |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| \| | 1 | 1 | 1 | 1 | 2014-03-17 | 00:00:00 |
| I | 2 | I | 2 |  | 2014-04-07 | 00:00:00 |
| I | 3 | I | 3 |  | 2014-05-07 | 12:48:00 |
| । | 3 | I | 4 |  | 2014-05-21 | 11:51:00 |
| I | 4 | I | 5 |  | 2014-06-04 | 10:50:00 |
